In addition to those areas already recognized as high-quality habitat, areas of adjacent habitat lacking sensitive vegetation or special-status plants have been included for the purposed of habitat restoration. The Proposed Project will require mitigation for impacts to sensitive habitat types and special-status plants. Habitat included within the open space preservation area represents an ideal location for habitat restoration efforts. This is due to the assurance of preservation within the open space, and the opportunity to increase the overall continuity and functionality of previously identified high-quality habitat.

4.0 OPEN SPACE AREA MAINTENANCE AND MONITORING

While the majority of the open space preservation area would remain largely undisturbed, specific maintenance activities are permitted to occur within the open space area beyond approved activities outlined in **Section 2.3**, including habitat restoration and mitigation and monitoring actions related to the Proposed Project. Fire damage incurred on the Ranch in the Valley Fire of 2015 emphasized the need to monitor and maintain vegetation against a changing fire regime. It is anticipated that grazing will be utilized, as included under the 2008 OSP and this OSPP amendment. No specific maintenance or monitoring activities are required through this plan.

5.0 ASSURANCE OF OPEN SPACE PRESERVATION

This document provides assurances that the designated open space as described here within shall be preserved in perpetuity. This OSPP shall be filed with the California Water Resources Board, as proof of

the changes made to the OSP included in the 2009 Water Right EIR. This OSPP will also be submitted to Lake County for approval. Approval of this document and maps presented herein shall serve as a binding agreement between the Ranch and Lake County.

Any future impacts for approved activities within the designated open space will be subject to additional mitigation in the form of preservation of acreage at a 1:1 ratio to impacts such that the goals outlined in this Plan are still achieved, and only with Lake County approval.

MIDDLETOWN SEWER CAPACITY ANALYSIS

21000 SANTA CLARA ROAD SUBDIVISION

SANITARY SEWER IMPACT ANALYSIS

DECEMBER 2019

INTRODUCTION

This study was conducted to determine the current capacity of the sewer system downstream of the proposed development as well as the proposed sewer impact from the 21000 Santa Clara Road Development. The existing downstream system is composed of two (2) pump stations and 6" and 8" gravity trunk lines.

EXISTING AND PROPOSED CONDITIONS

The existing site located at 21000 Santa Clara Road is composed of undeveloped land and has no discharge to the adjacent sewer system. There is a pump station (PS #2) located at the north east corner of the property. On the eastern edge of the property and 8" PVC sewer line (Line 1) runs from south to north, discharging into PS #2. On the north edge of the property is a 6" PVC line (Line 7) which runs from west to east, discharging into PS #2. East of the property there is an additional sewer line (Line 3), which is also 8" PVC and discharges into PS #2. PS #2 discharges in to 6" PVC force main, which runs to the west and into Pump Station #3 (PS #3), which discharges into another force main and runs to the treatment plant.

The proposed development at 21000 Santa Clara Road will have 50 new single-family units. All of these units will discharge into Line 1, the 8" sewer line which runs on the east side of the property. These 50 units will connect through two (2) new manholes along the 8" line, each of which will have half of the developments proposed discharge.

See attached maps for the "Existing Sewer Network" and the "Proposed Subdivision Utilities".

Design Analysis

Existing flows entering PS#2 and PS #3 for Dry weather flow are distributed per the following tables (Existing Dry Weather Distribution Tables). This table shows the lines discharging into the pump station, what estimated dry weather flows each pipe carries, and what percent of the flow to each pump station the pipe contributes: (See tables on next page)

Following the table are a series of calculations using Manning's Equation to determine the pipe capacity and the Hazen-Williams equations, in conjunction with system design information, to determine the pump flow rates. Previously collected record data for the pump station run times was also used to determine the existing system demands.

Existing Dry Weather Distribution Tables

EXISTING DEMANDS ON SYSTEM

Dry-Weather
6/6/06 – 6/11/06

Pump Station #2

Pump 1 - 8.2hrs / 5 days = 1.64hrs/day
Pump 2 - 8.4hrs / 5 days = 1.68hrs/day

Existing Usage – 3.32hrs / 24hrs = **13.83%**

Pump Station #3

Pump 1 – 9.8hrs / 5 days = 1.96hrs/day
Pump 2 – 8.9hrs / 5 days = 1.78hrs/day

Existing Usage - 3.74hrs / 24hrs = **15.58%**

Wet-Weather
10yr Event (12/30/06 – 1/3/06)

Pump Station #2

Pump 1 - 29hrs / 4 days = 7.25hrs/day
Pump 2 - 33hrs / 4 days = 8.25hrs/day

Existing Usage @ 10yr event - 15.5hrs / 24hrs = **64.58%**

Pump Station #3

Pump 1 – 26.9hrs / 4 days = 6.73hrs/day
Pump 2 – 27.9hrs / 4 days = 6.98hrs/day

Existing Usage @ 10yr event – 13.71hrs / 24hrs = **57.13%**

PUMP PERFORMANCE

Hazen-Williams Friction Loss Equation (Solved for Friction Loss)

Variables

Q = Quantity (cfs)
V = Velocity (ft/s)
D = Pipe Diameter (ft)
A = Pipe Area (ft)
L = Pipe Length (ft)
C = Hazen-Williams Coefficient (from table below)
Z1 – Z2 = Elevation Difference (ft)
g = Acceleration due to gravity (32.174 ft/s^2)
k = Unit conversion factor (1.318 for English units)
K_m = Minor Loss Coefficient (from table below)
h_f = Major (friction) Loss (ft)
h_m = Minor Loss (ft)

Equations

$$h_f = L\left[\frac{V}{k\,C\left(\frac{4}{D}\right)^{0.63}}\right]^{1\,/\,0.54} \qquad h_m = K_m\,\frac{V^2}{2g} \qquad Q = VA \qquad A = \frac{\pi}{4}D^2$$

Pump Station #2

Q = 1.1898 ft^3/s
V = 6.0594ft/s
D = 0.5ft
A = 0.1963ft^2
L = 1726ft
C = 145(PVC)
Z1 - Z2 = 6.55ft
K_m = 7.05
h_f = 32.73ft
h_m = 4.02ft

Pump Station #3

Q = 1.4009 ft^3/s
V = 4.0128ft/s
D = 0.6667ft
A = 0.3491ft^2
L = 10783ft
C = 145(PVC)
Z1 - Z2 = 57ft
K_m = 8.1
h_f = 68.15ft
h_m = 2.03ft

Existing Flows to PS#2

Existing flows below are derived using the pump performance rate and number of hours operated during both dry weather and wet weather (10-year storm) conditions.

Existing Dry Weather Flow to Pump Station #2

(1.1898 ft3/s)(3.32 hours) = 14,222 ft3/day

Capacity – 3.32hr/24hr = 13.8% capacity

Existing Wet Weather Flow to Pump Station #2

(1.1898 ft3/s)(15.5 hours) = 66,390 ft3/day

Capacity – 15.5hr/24hr = 64.6% capacity

Existing Flows to Line 1

Line 1 – Dry Weather is 19.3% of Total Pumped

Daily flow = 0.193 x 14,222 ft3/day x 1 day = 2,747 ft3

Average Flow = 2,747 ft3 / 86,400 sec = 0.0318 ft3/s

Peak Flow = 2.8 x 0.0318 ft3/s = 0.089 ft3/s

Total Capacity = 0.8227 ft3/s

Pipe @ 10.8% capacity

Line 1 – Wet Weather is apx. 46% of total flow pumped (per previous analysis of sewer system)

Daily flow = 0.4671 x 66,390 ft3/day x 1 day = 31,010 ft3

Average Flow = 31,010 ft3 / 86,400 sec = 0.3589 ft3/s

Peak Flow = 1.5 x 0.3589 ft3/s = 0.5384 ft3/s

Total Capacity = 0.8227 ft3/s

Pipe @ 65.4% capacity

Conclusion

The existing sewer system including gravity mains, pump station, and force mains have the capacity to support the proposed project. See below for a summary of the proposed impacts to the existing system on a flow rate and percentage of capacity basis.

Line #1

New Flow is 50 residential units @ 210 gpd each = 1,404 ft3/day

Average Flow = 0.0163 ft3/sec

Peak Flow = 2.8 x 0.0163 = 0.0455 ft3/sec

Additional 5.5% of capacity due to development

After development the pipe will be at:

18.0% of capacity during dry weather

70.9% of capacity during 10-year storm event

Line #3, #7, and #8 will not be affected by this project.

Pump Station #2

New Flow is 50 residential units @ 210 gpd each = 1,404 ft3/day

1,404 ft3 / 1.1898 ft3/s = 1,180 sec

1,180 sec / 86,400 sec = 1.36%

New flow is 1.36% of pump station capacity

Pump Station will be:

@ 15.16% of capacity during dry weather flows

@ 66.0% of capacity during 10-year storm events

Pump Station #3

New Flow is 50 residential units @ 210 gpd each = 1,404 ft3/day

1,404 ft3 / 1.401 ft3/s = 1,002 sec

1,002 sec / 86,400 sec = 1.16%

New flow is 1.16% of pump station capacity

Pump Station will be:

@ 16.74% of capacity during dry weather flows

@ 58.29% of capacity during 10-year storm events

SECTION 1 INTRODUCTION

SECTION 1 INTRODUCTION

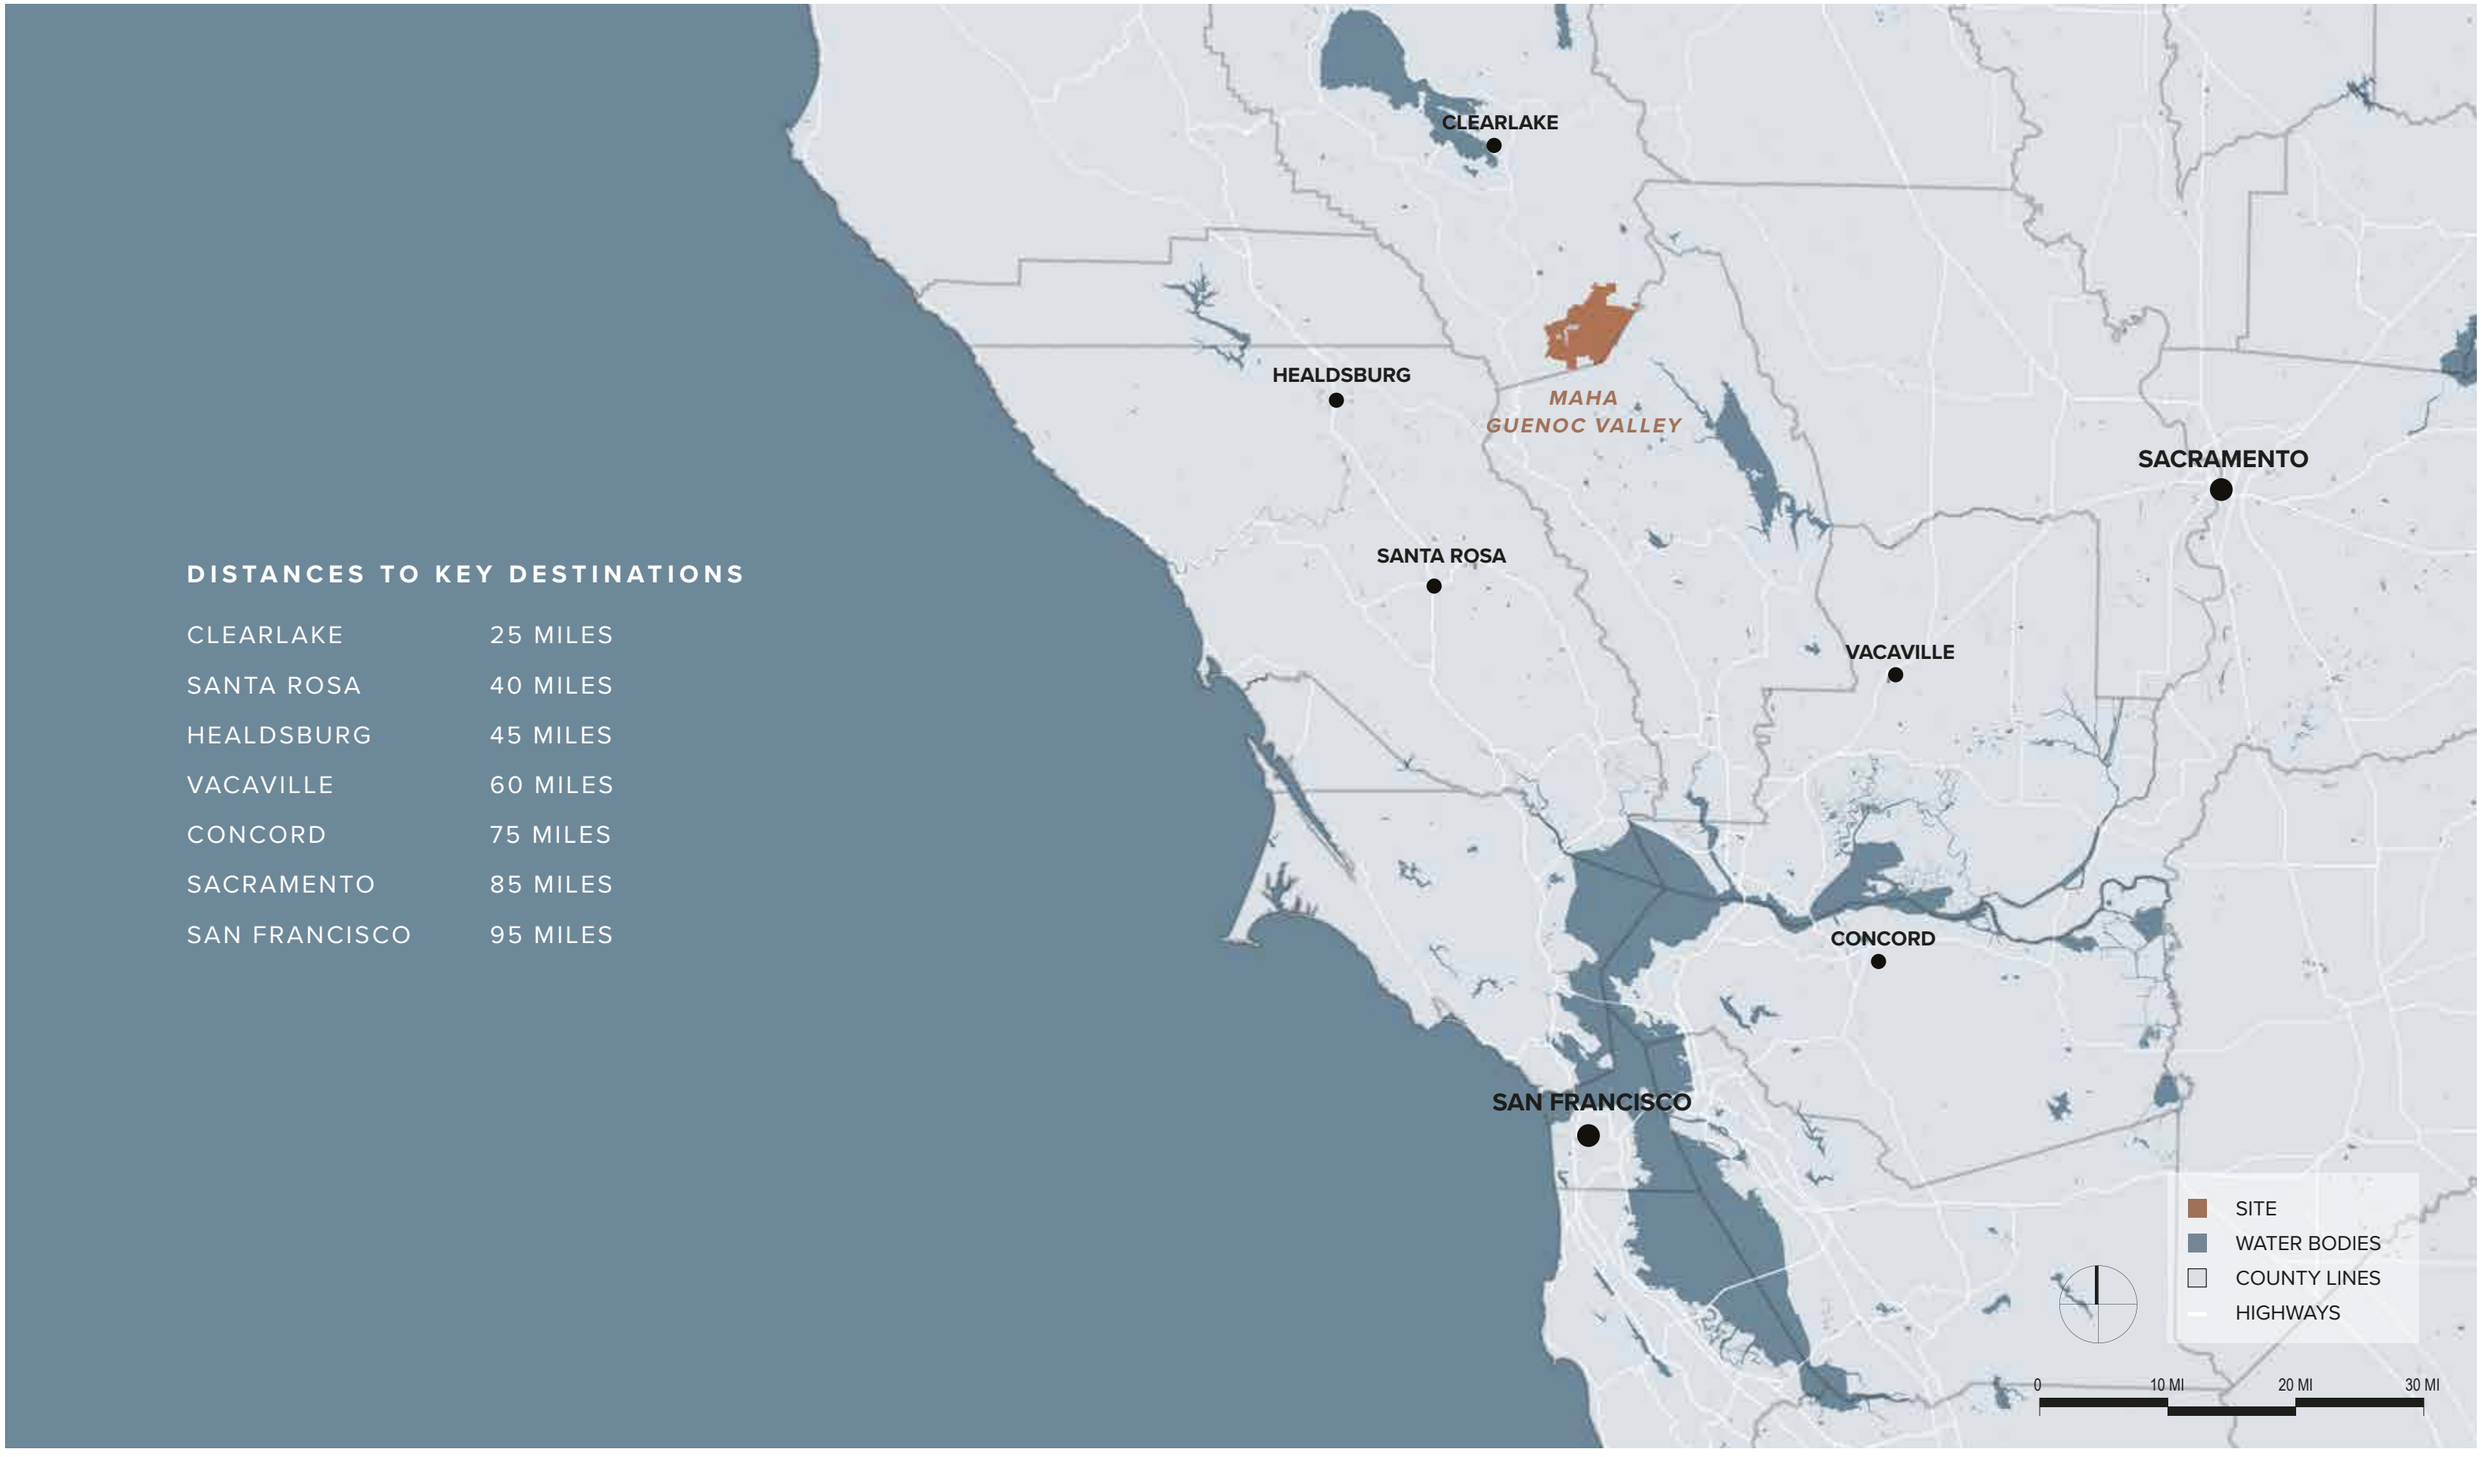
SITE CONTEXT

The main project site, currently consisting of 49 assessor's parcels totaling approximately 16,000 acres within Guenoc Valley, is located three miles southeast of Middletown on the southeast border of Lake County, bordering Yolo and Napa Counties to the south and east, with primary access along Butts Canyon Road. The Guenoc Ranch remains one of the largest privately owned properties in the state of California. It is bordered by Hidden Valley Lake community, to the northwest, which is undergoing continued development.

Guenoc Valley is a small inland valley set on an alluvial fan, isolated from surrounding areas by rocky ridges and volcanic rock. As part of the inner coastal range of Northern California, the site is characterized by uniquely varied topography, with rolling hills, oak woodlands, irrigated vineyards, grazing corridors, open space, and meadows. Ground elevation ranges from 62 to 950 feet above sea level. The average rainfall is 35 inches a year, slightly less than neighboring Middletown, with slightly greater seasonal temperatures, and generally less severe fog.

An existing loop road currently provides access from Guenoc Road, which intersects Butts Canyon Road across from the Detert Reservoir. The project anticipates continued utilization of the existing loop road, with a new intersection to be located approximately just over one mile from the existing intersection to the Langtry Winery.

PROJECT SITE LOCATION



DISTANCES TO KEY DESTINATIONS

SACRAMENTO	85 MILES
SAN FRANCISCO	95 MILES

PROJECT BACKGROUND

Current ownership, under the management of Lotusland Investment Holdings, Inc., has approached the County of Lake with a development proposal in alignment with the objectives of the Middletown Area Plan Special Study Area. The intention of the developers is to transform the property into a twenty-first century rural idyll, combining state-of-the-art hospitality and recreational facilities set in the timeless beauty of the land. The vision of the Maha Resort at Guenoc Valley is a destination resort of unparalleled luxury, featuring internationally acclaimed architect-designed boutique hotels with products and amenities from local artisans and farms, providing a luxurious experience within the scope of a master-planned mixed-use development.

Maha reflects the area's local stewardship, historic retreat culture and longstanding agricultural traditions. The proposed development features low-impact development as well as smart growth techniques in order to preserve the legacy and identity of the ranch for future generations. The master plan will incorporate land management practices that support open space preservation with an integrative animal husbandry element along with fuel reduction management.

To fulfill our vision of a world-renowned brand offering a luxurious experience in an iconic natural setting, the project demands uncompromising excellence in all regards. This extends into planning, plans for construction, operations and maintenance, as presented in the following submittals for your review.

LAKE COUNTY APPROVAL PROCESS

The project is entirely within the jurisdiction of the County of Lake. The approval process includes an Environmental Impact Report (EIR) pursuant to the California Environmental Quality Act (CEQA).

The project requests the following entitlements: 1) General Plan Amendment; 2) adoption of a new zoning classification: Guenoc Valley Mixed Use Planned Development District (GVD); 3) Use Permit to allow a Specific Plan of Development (SPOD); 4) General Plan of Development; 5) Development Agreement, and 6) Tentative Subdivision Maps.

EXISTING LAND USE POLICIES & PROPOSED ENTITLEMENTS

The project adheres to the framework of the existing Lake County land use policies and goals as defined by the General Plan and it also meets the objectives of the specific plan for this area as defined by the Middletown Area Plan. As directed by the Area Plan, the Guenoc Ranch will be rezoned to accommodate planned resort development. The planned development will be designed as mixed-use, comprising resort, resort commercial, residential, and agriculture as previously anticipated in the Area Plan.

The approval process for the proposed entitlements includes multiple public meetings and hearings before the Planning Commission before seeking ultimate approval by the Board of Supervisors. The new zoning designation, Guenoc Valley District (GVD), includes proposed development standards outlined in the draft zoning ordinance section. These are consistent with the County's existing Commercial and Residential Planned Development zoning designations as requested by the Area Plan. The proposed entitlements utilize the Planned Development process for the long term growth of the Maha Resort at Guenoc Valley. This recognizes efficient land utilization and preservation of open space in conjunction with fire-safe measures already required by the County Fire Safe Regulations. It also includes additional measures that Maha Resort proposes in the Emergency Action and Fire Management Plan.

Currently, the Property is zoned Agricultural and Rural Lands. The Middletown Area Plan, which furthers the intentions of the General Plan, highlights this district as an appropriate site for a mixed-use planned development. To bring the property into conformity with the mixed-use resort-centric development of the Middletown Area Plan, and by extension the General Plan, a rezoning is required. The County currently has three zoning designations allowing mixed-use development: Commercial Resort, Planned Development Residential, and Planned Development Commercial. Due to the intermingling of resort, commercial, and residential uses; no single existing zoning designation is appropriate for the property. Therefore, GVD is a blend of all three zoning practices.

EXECUTIVE SUMMARY

This Specific Plan of Development details the first and primary phase of the Maha Resort at Guenoc Valley. Inspired by the landscape and heritage of this extraordinary property the proposal incorporates low impact sustainable development and smart growth techniques with a commitment to preserving the legacy and identity of the ranch for future generations. The PROJECT is organized into individual resort communities, defined by low impact designs that prioritize low density and clustered development, preserving surrounding open space and agricultural cultivation. These resort communities are situated within the natural landscapes to minimize construction impacts and connect guests seamlessly with the land. The PROJECT proposes diversified agricultural production to include gardens, culinary education, farmers markets, and agricultural retail sales and opportunities for local artisans and business. The vision of the Maha Resort champions the commitment to on-site production and self-reliance as a pillar of its excellence in design, impact, and narrative as evident in the sustainability efforts and community benefits.

COMMUNITY BENEFITS

This project provides employment training and opportunities for both the construction and the hospitality industries. It anticipates relying on over 500 construction workers over the next 10 years as well as 300, year round, full time hospitality, maintenance, and administrative employment within the first phase. The project will also result in traffic improvements along Butts Canyon Road within the project area. Furthermore, increased tax revenue for the County, through transient occupancy taxes and property taxes, will directly benefit the community.

SUSTAINABILITY EFFORTS

The Maha Guenoc Valley development and ownership team are dedicated to low impact development existing with the natural landscape. PROJECT goals include: recycle 100 percent commercial wastewater, zero net electrical energy, propose building code standards that exceed minimum requirements for fire resiliency, installation of electric car charging ports. Additionally, the PROJECT dedicated a large open space area, native plant nursery, and the PROJECT keystone of agrotourism offerings such as the farm-to-table experience.

Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

LOW-IMPACT DESIGN

Each resort community will include a mixture of hotel Units, Resort Residential, and Residential Villas. The clustering of development reduces the sprawl of the development and results in consolidated hubs for the guest to enjoy while preserving the rural landscape and agricultural qualities of the Property. Both the Resort Residential and the Residential Villas are intended for subdivision. This results in a very low density, an average of 0.1 unit per acre, with the average lot size of 5 acres with portions of each lot in conservation, which is similar to surrounding rural residential context. Roadways and typical buildings are accurately scaled in the site plan below to demonstrate the low-impact design.

RESIDENTIAL UNITS PER ACRE IN RESORT COMMUNITIES

0.18 BOHN RIDGE RESORT COMMUNITY

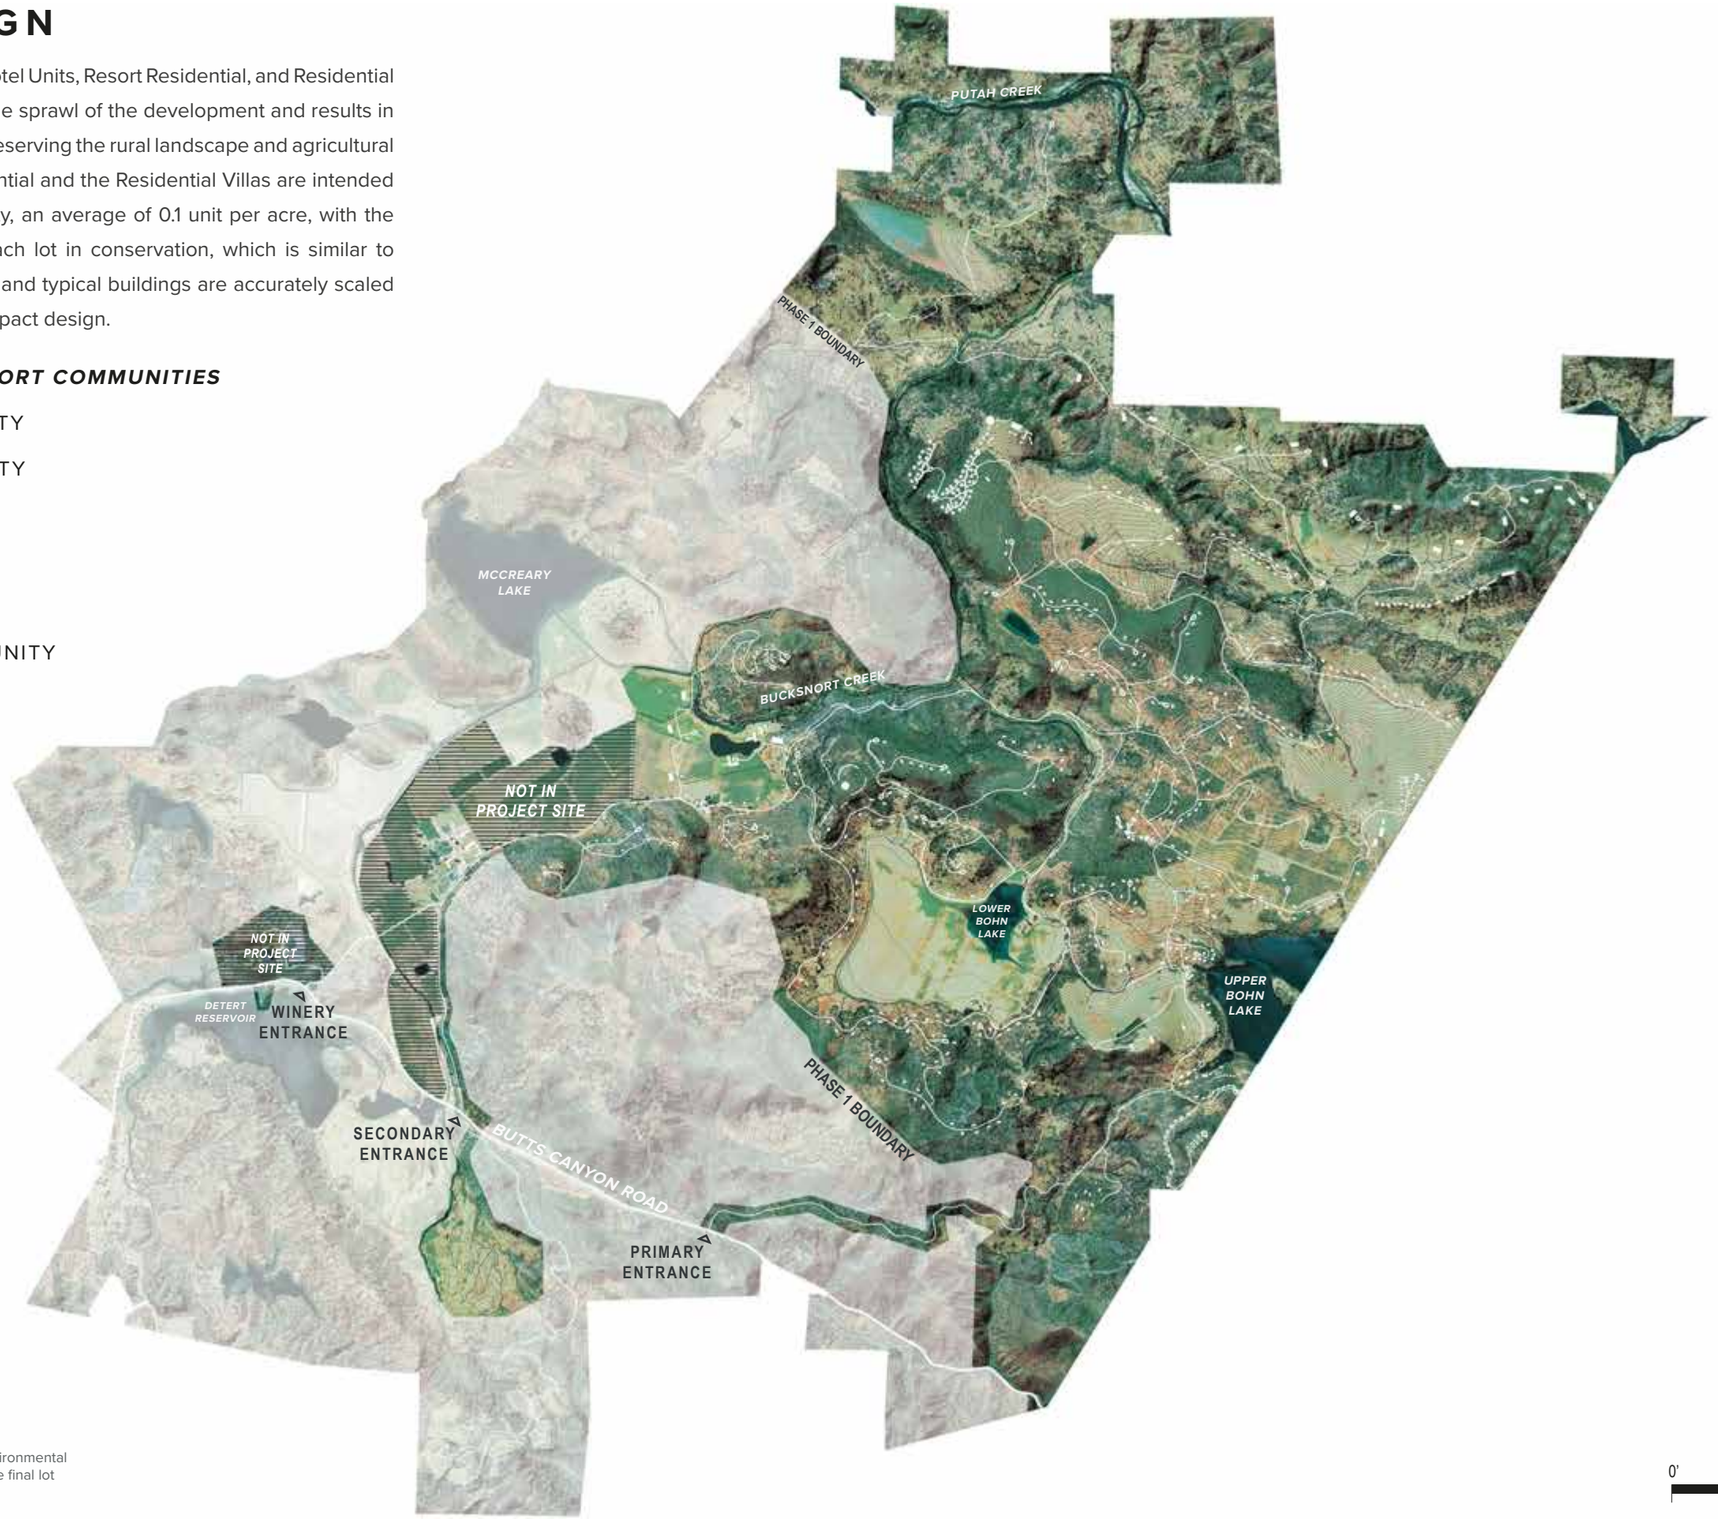
0.14 EQUESTRIAN CENTER COMMUNITY

0.12 MAHA FARM COMMUNITY

0.18 RED HILL ESTATES COMMUNITY

0.12 SPA COMMUNITY

0.03 RESORT AT TROUT FLAT COMMUNITY



NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

RESORT COMMUNITIES

Although the site boundary determines the extent of Maha Guenoc Valley project, a majority of development will occur within a series of resort communities. These resort communities—as defined by the boundaries shown below—include a series of amenities and structures all designed by the same architect. Each resort community will include a signature boutique hotel accompanied by a series of residential properties. These hotels, resorts, and resort communities will be further described in Section 3: Architecture and Land Use Plans.

	HOTEL UNITS	RESORT RESIDENTIAL UNITS	RESIDENTIAL ESTATES
BOHN RIDGE RESORT COMMUNITY	31	30	38

ENVIRONMENTAL REVIEW

ENVIRONMENTAL REVIEW

The General Plan Amendment, and Area Plan Special Study Area No.3 map amendment, propose the GVD district. The project entitlements will be subject to both a program-level and project-level Environmental Impact Report (“EIR”), administered under the direction of the County of Lake; the project-level analysis will address the first phase of the Maha Resort, with subsequent phases of the project analyzed at a programmatic level.

The unique size, scale, and distinctiveness of the project will have a significant beneficial impact on the local community. Considering the multiple natural disasters in the last three years, the project we are proposing should offer many welcome benefits to the County (see the Community Benefit Map). Contributions to the County’s economy include new housing, workforce options, expansion of tourism, agriculture, and an overall increase in community pride. This project will include farm-to-table experiences, outdoor and indoor recreational uses, expansion of agricultural uses, workforce housing, open space preservation, and new jobs. Environmentally, this project also includes exceptional landscape management, proactive fire mitigation planning, and commitments to on-site renewable water reuse and potential renewable energy generation.

SECTION 2 LANDSCAPE

GUENOC VALLEY LANDSCAPE

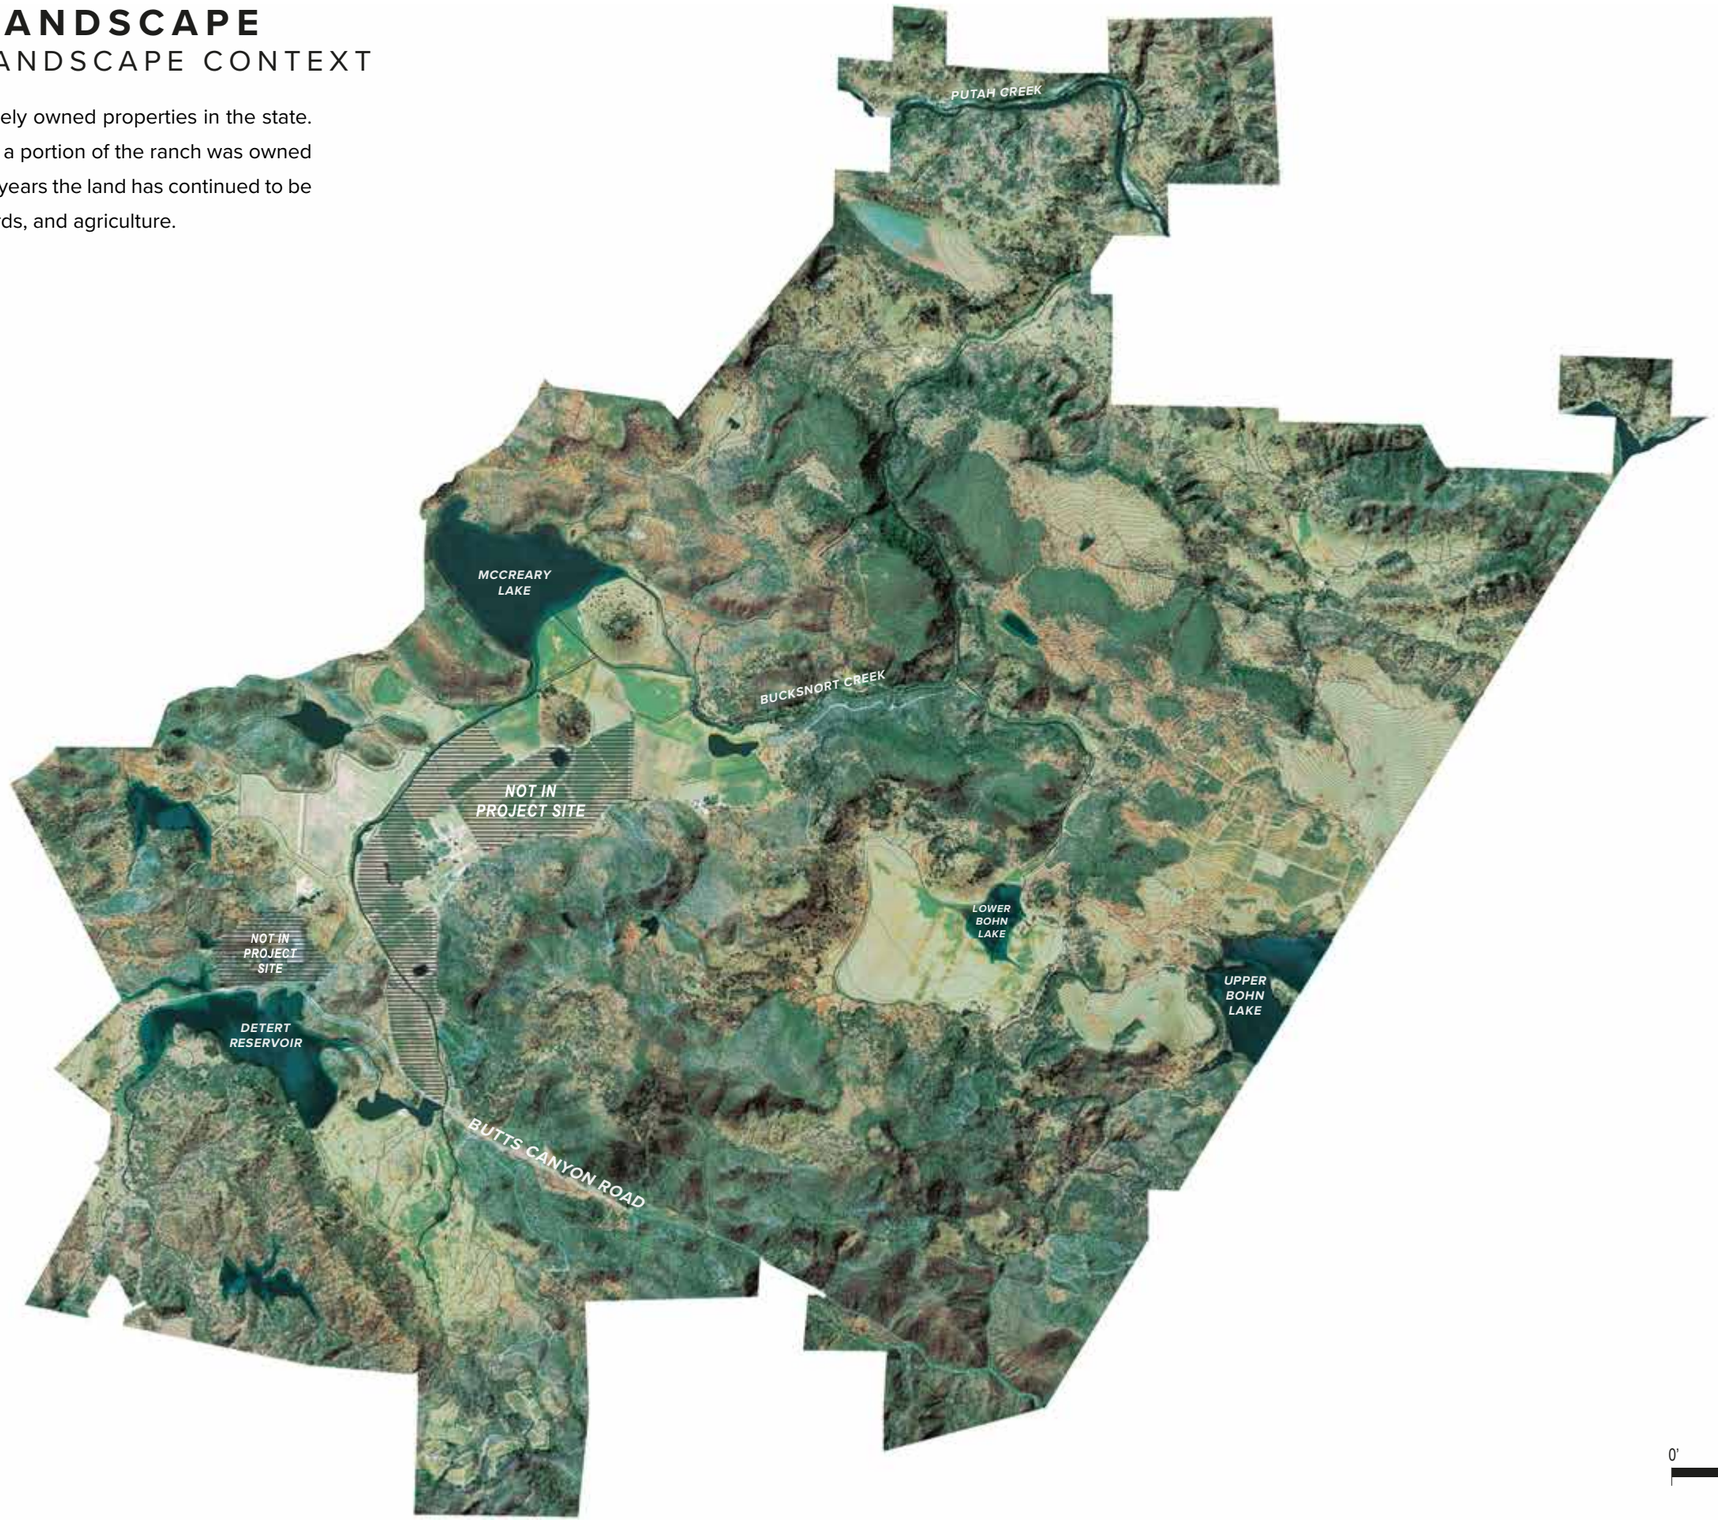
The project, currently consisting of 49 assessor's parcels totaling approximately 16,000 acres within Guenoc Valley, is located three miles southeast of Middletown on the southeast border of Lake County, bordering Yolo and Napa Counties to the south and east, with primary access along Butts Canyon Road. The Guenoc Ranch remains one of the largest privately owned properties in the state of California. The Hidden Valley Lake community, to the northwest, is undergoing continued development.

Guenoc Valley is a small inland valley set on an alluvial fan, isolated from surrounding areas by rocky ridges and volcanic rock. As part of the inner coastal range of Northern California, the site is characterized by uniquely varied topography, with rolling hills, oak woodlands, irrigated vineyards, grazing corridors, open space, and meadows. Ground elevation ranges from 62 to 950 feet above sea level. The average rainfall is 35 inches a year, slightly less than neighboring Middletown, with slightly greater seasonal temperatures, and generally less severe fog.

An existing loop road currently provides access from Guenoc Road, which intersects Butts Canyon Road across from the Detert Reservoir. The project anticipates continued utilization of the existing loop road, with a new intersection to be located approximately just over 1 mile from the existing intersection to the Langtry Winery.

GUENOC VALLEY LANDSCAPE
EXISTING & HISTORIC LANDSCAPE CONTEXT

Guenoc Ranch remains one of the largest privately owned properties in the state. The property first came to public attention when a portion of the ranch was owned by the British Actress, Lillie Langtry. Through the years the land has continued to be utilized for outdoor recreational pursuits, vineyards, and agriculture.



GUENOC VALLEY LANDSCAPE
VEGETATION TYPES

Guenoc Valley, a small inland valley, is comprised of varying landscape and vegetation characteristics. The site experiences greater seasonal temperature extremes than neighboring areas, and has a wide range of elevation changes throughout the property. At these varying elevations are a variety of existing vegetation vegetation types and uses, including agricultural areas, grasslands, chaparral, oak woodlands, and general forestland.

a detailed survey of existing vegetation will be submitted under a seperate cover

GUENOC VALLEY LANDSCAPE
AGRICULTURAL OPERATIONS

Historically Guenoc Valley has been grazed by cattle and sheep for centuries. In 1925 William F. Detert built Detert Reservoir and started a valley floor irrigation project that portions of are still being used today. After irrigation was introduced to Guenoc Valley, it became possible to grow more agricultural crops, but the property was mostly used for forage crops to support the existing grazing operations. At the time of the most recent acquisition of Guenoc Ranch, the property had been farmed for more than a century. At present there is still a significant cattle and sheep operation in conjunction with the vineyards.

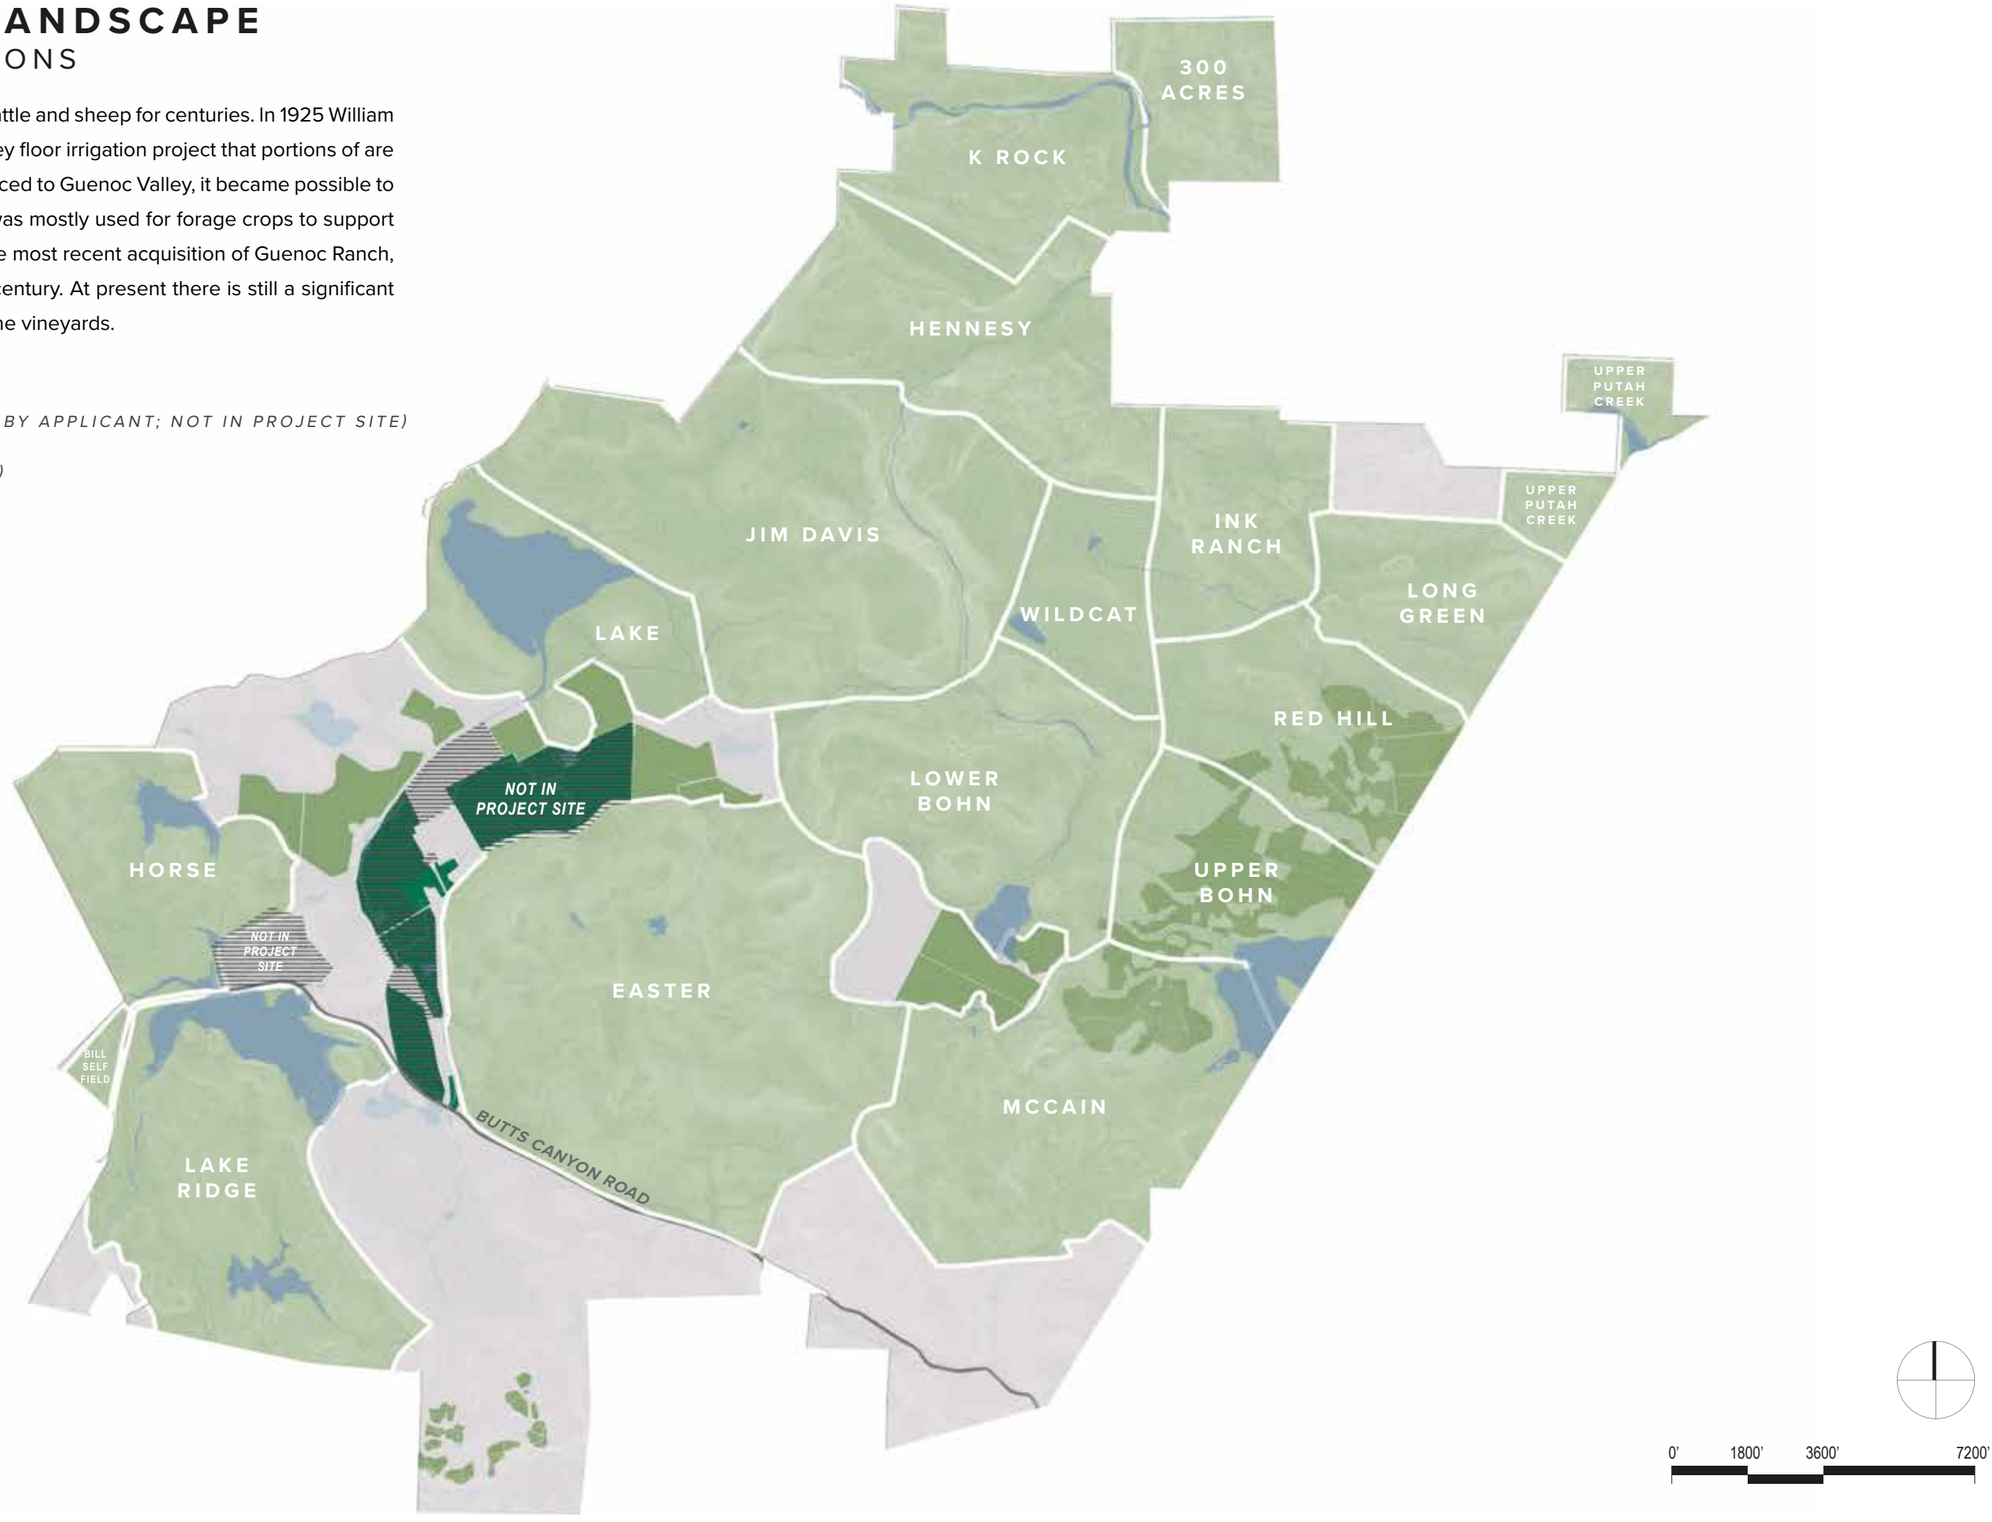
- FOLEY VINEYARDS *(NOT OWNED BY APPLICANT; NOT IN PROJECT SITE)*
- PASTURES *(PASTURE NAME NOTED)*

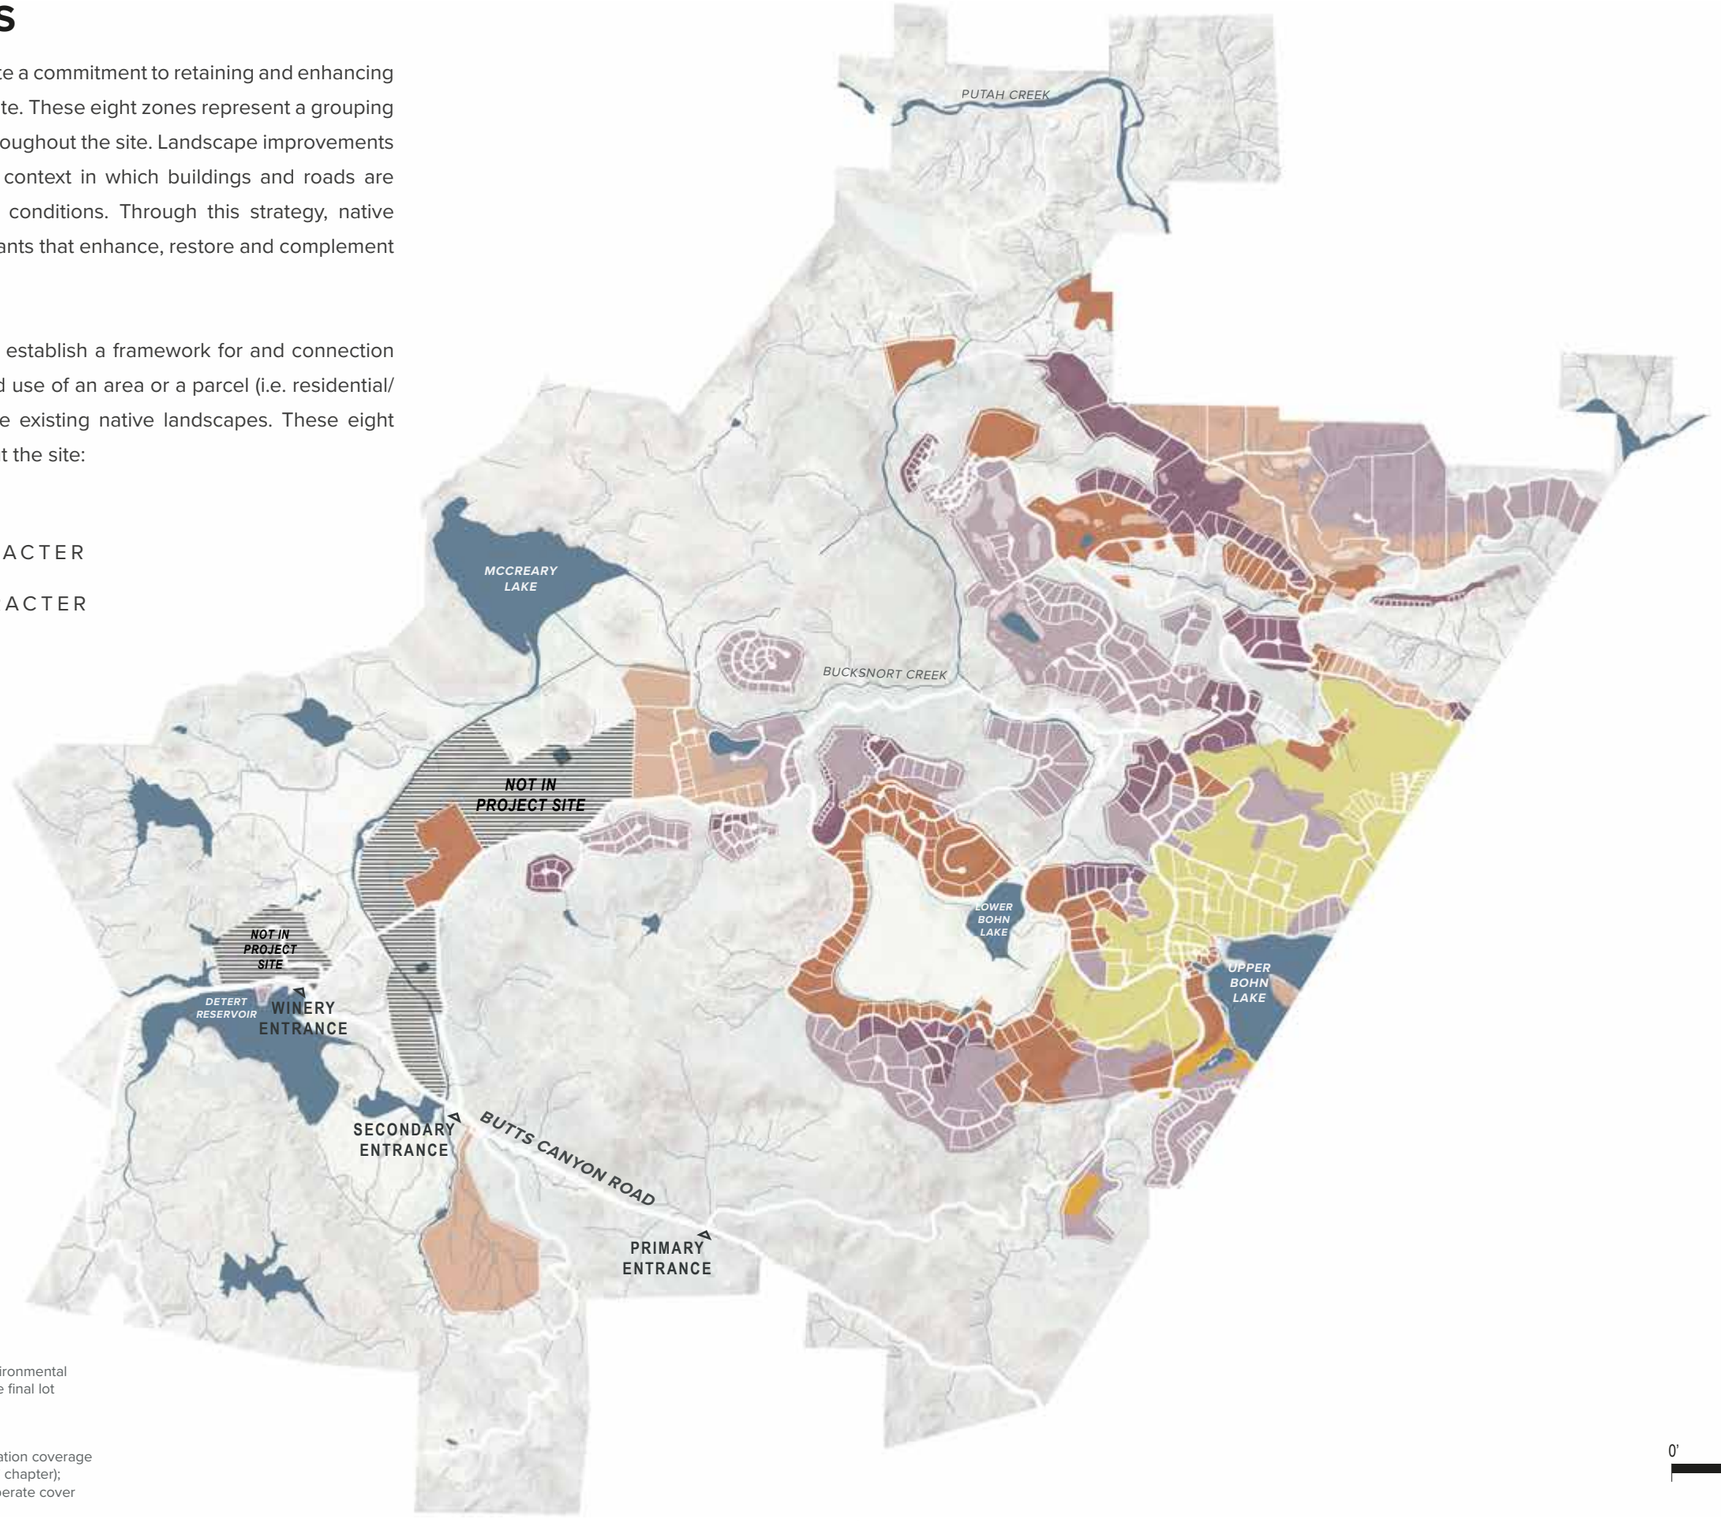


LANDSCAPE ZONES

The eight proposed landscape zones demonstrate a commitment to retaining and enhancing the existing landscape patterns throughout the site. These eight zones represent a grouping of a majority of landscape communities found throughout the site. Landscape improvements will exhibit a ‘light-touch’ approach, creating a context in which buildings and roads are closely integrated with the present landscape conditions. Through this strategy, native landscapes will be supplemented by adaptive plants that enhance, restore and complement the existing site character.

These proposed landscape zones are intended establish a framework for and connection between the landscape character of an intended use of an area or a parcel (i.e. residential/ commercial development or recreation) and the existing native landscapes. These eight zones will guide landscape strategies throughout the site:

- WOODLAND CHARACTER
- CHAPARRAL WOODLAND CHARACTER
- GRASSLAND WOODLAND CHARACTER
- GRASSLAND CHARACTER
- VINEYARDS CHARACTER
- FARMLAND CHARACTER
- WATERSIDE CHARACTER
- RURAL LANDSCAPES & RECREATION AREAS



NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

SOURCE
Landscape zones concept based on public sources of existing vegetation coverage (see “Vegetation Types” exhibit with the “Guneoc Valley Landscapes” chapter); a detailed survey of existing vegetation will be submitted under a seperate cover

LANDSCAPE ZONES DESCRIPTIONS

WOODLAND CHARACTER

These areas are dominated by dense groves of oak woodlands, including the Blue Oak and the Valley Oak. Any landscape improvements within this zone will be limited to areas directly adjacent to buildings and roadways within low-impact residential and commercial development. Every effort will be made to enhance and emulate the existing woodland condition and preserve oaks during the development process, as these trees will be essential the residential and resort character throughout this zone.

CHAPARRAL WOODLAND CHARACTER

The Chaparral Woodland zone is characterized by often dense growth of chaparral species and scattered oak, pine and other trees. Seasonally varied, the large shrub species include Toyon, manzanita, chemise, grasses and other species. This vegetative community has been impacted by fire in the recent past and requires particular attention to manage, restore and maintain in a healthy, beautiful state.

GRASSLAND WOODLAND CHARACTER

The Grassland Woodland Zone, as its name suggests, consists of an understory of grasses and wildflowers under varied tree canopies. Historically grazing has been, and will continue to be instrumental in maintaining this landscape character throughout large portions of the Guenoc Valley site. The Grassland Woodland association will be the predominant approach and character for landscape improvements along roadways and residential development areas.

GRASSLAND CHARACTER

The Grassland Zone, naturally occurs in several portions of the site both south and north of Butts Canyon Road. Grasslands are characterized by a variety of native and non-native grasses and wildflowers with limited tree and chaparral cover. Landscape development within the Grassland zone will emphasize use of drought-tolerant native grasses, wildflowers and limited tree planting. Grasslands outside of development areas will continue to be managed for grazing.

VINEYARDS CHARACTER

Wine grape vineyards have been and will continue to provide an important and dominant landscape use and character for Guenoc Valley. The working vineyards will provide a strong visual connection to the site's history and a basis for an agricultural/agrarian landscape expression characterized by windrows, tree-lined roadways, special fencing and planting of vineyard perimeters. The irrigated vineyards also play an important role in providing irrigated and managed landscape, a key component minimizing fire risk.

FARMLAND CHARACTER

Productive farmlands are an important landscape character initially located at the Maha Farm, and will provide substantial food and fiber sources for guests, residents, and the local community. The farmlands will be intensively managed and include vegetable gardens, orchards, herbs, flowers, animal products and fiber sources. To the extent feasible, edible plantings will be extended beyond the large garden and orchards to guest patios, roadway plantings or other appropriate areas to create an integrated productive landscape experience.

WATERSIDE CHARACTER

Areas identified as Waterside Character include existing lakes, streams, seasonal drainages, and wetlands,. Development within and adjacent to waterside areas will include riparian plantings appropriate for the seasonal changes of water levels and flows that will transition to the adjacent landscape character in the uplands.

RURAL LANDSCAPES & RECREATION AREAS

The majority of the site will be maintained in a natural, rural state, supporting continued grazing and limited recreation uses such as hiking, horseback riding or similar uses. Except for the vineyards and farmland character zones, all other landscape types occur throughout this zone.

LANDSCAPE ZONES COMMON EXISTING PLANTS

Each Landscape Zone includes a variety of existing plant species, both native and non-native, with some overlap between zones, examples shown here. New development or restoration within any single zone will include a carefully selected list of existing species including grasses, shrubs and trees to distinguish the area and to provide a framework for new landscapes.

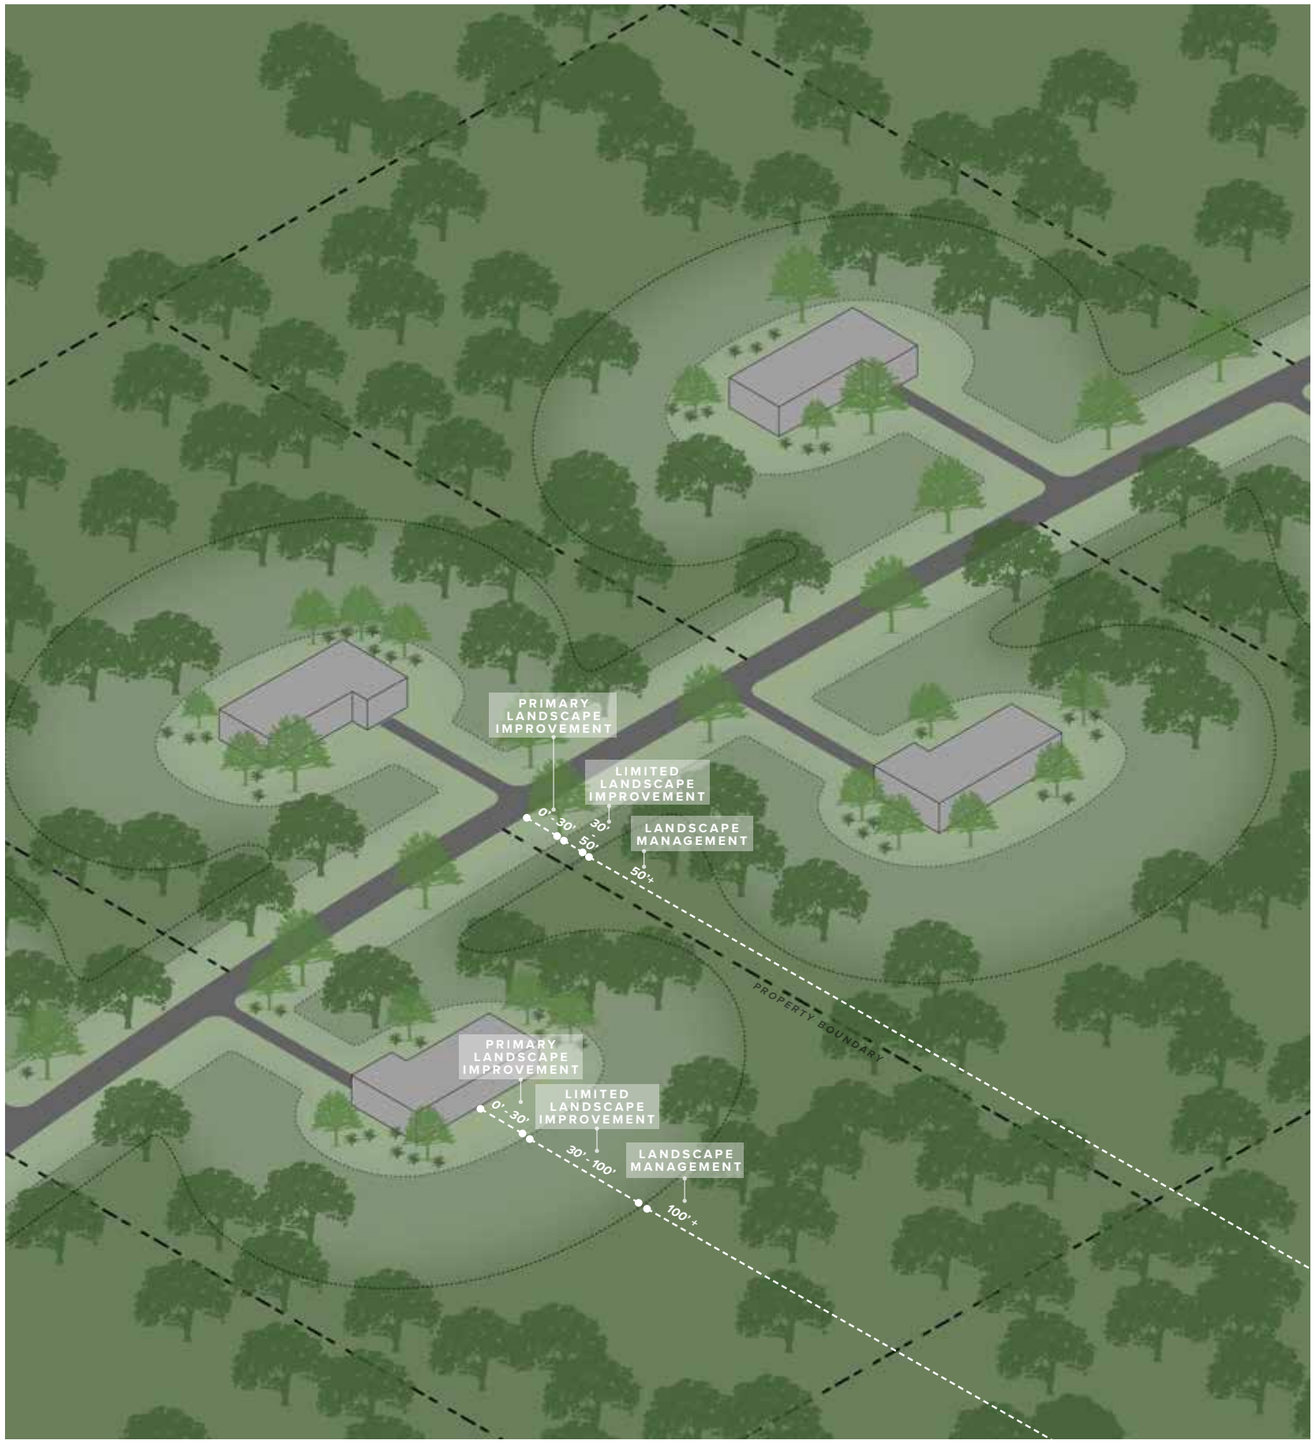
LANDSCAPE ZONES TYPICAL LANDSCAPE STRATEGY



LANDSCAPE IMPROVEMENT EXTENTS

The overall approach to landscape improvements throughout the site are to exhibit a “light touch” approach that emphasizes the existing natural and rural character. New landscaping will generally provide a transition between more highly developed (and irrigated) landscapes near buildings and selectively along roadways to more natural landscapes managed to reduce fire risk.

PRIMARY LANDSCAPE IMPROVEMENT

0’ - 30’ FROM EDGE OF ROADS AND BUILDINGS

The majority of newly planted and irrigated landscape will be within this area. The landscape design will be guided by the landscape zone character and fuel reduction standard, which includes a priortization of native and low fuel vegetation.

LIMITED LANDSCAPE IMPROVEMENT

30’ - 50’ FROM EDGE OF ROADWAYS; 30’ - 100’ FROM EDGE OF BUILDINGS

A limited amount of landscape improvement will occur within this buffer area. The landscape improvements within this area will be minimal, and mostly involve defining the edges of the landscape design and reducing vegetated fire risk.

LANDSCAPE MANAGEMENT

BEYOND 50’ FROM EDGE OF ROADWAYS; BEYOND 100’ FROM EDGE OF BUILDINGS

Within this area, plants and vegetated conditions with a high fire risk concern will be selectively addressed. This will primarily include cutting down dead and highly-combustible vegetation. Otherwise, the existing landscape will be conserved to the maximum extent.

AGRICULTURE

Both historic and active agricultural practices such as vineyards and grazing operations are part of the culture of the Guenoc Valley. The PROJECT proposes to continue this historic land use culture and expand it for on-site food production. Furthering agriculture within Guenoc Valley, through promotion of local produce and artisans' products, farm-to-table restaurants, farmers markets, and recreational activities, will ensure the continued viability of Lake County's agricultural culture and economy. Furthermore, the grazing of livestock on the landscape enhances agri-tourism experiences, helps promote local agricultural products and supports fire management strategies for vegetative management. By farming grass-fed beef, sheep and goats, the PROJECT will create a variety of opportunities for agriculture within the Maha Farm and throughout the site.

VINEYARDS

In the late 1970's, some irrigated vineyards were planted, and in 1980 construction started on Guenoc Winery which is still in production today. Most of the Valley floor is now vineyard, and vineyards are being planted throughout the property, irrigated from numerous lakes on the site. There are 964 acres of vineyards currently planted.

DIVERSIFIED AGRICULTURE

The following farming activities will occur at Maha Farm and throughout the site:

A CSA program for residents – A Community Supported Agriculture (CSA) program consists of a community of individuals who pledge support to a farm operation by paying a subscription fee to get various products delivered. The community and the growers provide mutual support and share in the risks and benefits of food production. Residents who opt to participate in a CSA program as well as the visitors will be able to purchase beef from the resident herd, pursuant to USDA laws about purchasing grass fed beef shares. (Animals are purchased directly from the farm, but slaughtered, butchered and wrapped at a USDA facility.)

Beef for restaurants & retail – Beef from the resident herd, once slaughtered and butchered off-site, will be returned to an on-site butchery for further handling. Thus, beef from the on-site herd can be supplied to the on-site restaurants, and also sold at retail outlets at the Maha Farm.

Tallow candles & beef cuts for retail sale – Beef tallow can be used to create candles for workshops and for sale in various retail outlets, including the Farmer's Market and Grocery.

Lamb for restaurants & retail – Lamb from either the on-site resident herd or from the seasonal herd will be sent off-site to a certified slaughter facility and butchering facility, and a small portion will be processed by the Maha butchery for sale to restaurants and at the farmer's market and included as a CSA option as well.

Wool shearing and fiber spinning – Wool sheared from the sheep that graze the site can be hand-processed into fiber products including hand-spinning and felted products used for on-site workshops. Wool can then be turned into various fiber products and sold on-site.

Agriculture and Horticulture – Up to five acres will be allocated on the Maha Farm site for the production of annual and perennial crops to produce a suite of mixed vegetables, fruits, and nuts. Value-added products, including pickling and jam preserves will also be processed on-site.

Hedgerows, windbreaks, and Integrated Pest Management (IPM) – Native Hedgerows will be planted for a variety of uses, including: aesthetic landscape borders, fire breaks, pollinator and bird habitat, carbon sequestration and other ecosystem services. These hedgerows will be places in various locations around the Maha Farm to ensure adequate plant material for harvesting (willow, dye plants) and provide resources for local fauna and flora, including perennials that will bloom during the times when bees may require extra forage.

Flower Farm – a small portion of the garden area within the Maha Farm's mixed vegetable/orchard will be set aside for the growing of flowers for the Maha hotels and also for sale in the farmer's market and other retail outlets. This will be managed by a resident flower-farmer, tending to a year-round flower and dye garden.

Agroforestry & poultry production – Integrated into the farm operation in further phases of the development will be a small-scale pastured poultry operation, which will help manage insect populations, fertilize soil, and contribute to the overall aesthetics of the farm, in addition to providing eggs on-site and meat for resident and guest consumption. Meat Birds will be processed at a state-inspected slaughter facility such as American Poultry, in Sacramento, or the Rabbit barn, Turlock or Mary's Chicken in Petaluma. Ultimately, Maha will consider investing in developing its own state-inspected meat bird facility.

Apothecary with Herbs Processing Facility – This will showcase an "old-timey" country store that sells dried herbs and tinctures, alongside teas, herbs, soaps, candles, and a variety of other natural products available for purchase. Many of these will be produced on-site and there is ample opportunity to educate customers about the source ingredients, enhancing their connection to the property.

On-site bee operation (for honey and bee pollen) – An on-site bee operation with at least 30 hives can supply the restaurant and various on-site retail areas with honey and bee pollen.

Small-scale dairy – In later phases of the PROJECT a regenerative, pasture-based dairy may be developed to ensure high-quality local dairy products for client consumption.

Aquaculture / aquaponics – Aquaponics is slated to be incorporated into the farming system.

Greenwave – bivalves + purple urchins – We are considering a polyculture farming system that can yield shellfish and seaweed. This system can also incorporate the production of purple urchins.

Wild forage – Opportunities to forage for native plants, including mushrooms, will be offered under the supervision of a certified mycologist or botanist.

Composting – All organic materials will be composted on-site in compliance with CA Air Resources, CA Water Resources board and CALRecycle on-site composting regulations. SOPs for appropriate composting will be regularly updated and there will be a compost manager assigned to manage the composting and stay updated with the regulatory environment. To minimize the amount of greenhouse gas emissions from composting, we are considering utilizing an Aerated Static Pile composting system.

FARMING ACTIVITIES AT MAHA FARM

VEGETABLE GARDENS, FARMING ISLANDS, FRUIT & NUT ORCHARDS

The farm-to-table concept for the restaurants and hotel service offered by the resort is supported by extensive vegetable gardens, native plant foraging areas and fruit & nut orchards located throughout Maha Farm. The productive growing areas are located in and around the Village, centered on the Market Garden Barn Hub, as well as a showcase restaurant garden at the Sales Center at Hilltop Lodge.

GRAZING ACTIVITIES

The PROJECT's grazing plan takes a current on-site use and continues that use while harnessing the potential for landscape management, providing high fuel load vegetation reduction and site-wide fire mitigation activities.

The PROJECT is committed to landscape stewardship. The managed grazing of livestock is a primary tenet of sustainable agriculture and fire prevention both in the open space and designated corridors. Well-managed grazing balances regular and systematic movement of animals to forage and reduce fuel loads thought the site. Targeted grazing by expanding the current use of cattle, sheep or goats can measurably reduce or eliminated fire ladders, therefore promoting fire resilience on site. Additionally, grazing promotes grassland health and diversity, reduces internal susceptibility to wildfires, and increases soil organic carbon helping the on-site water retention. Therefore, Maha Resort utilizes managed grazing in our comprehensive fire management plan.

GRAZING STANDARDS MATRIX

The following matrix provides general standards to guide site-wide, long-term grazing practices. Although the exact configuration of grazing areas and corridors may shift over time, these general parameters will help to coordinate the placement and movement of herds throughout the site.

Species	**Primary Foraging Behavior**	**Equivalent Animal Unit** *	**Preferred Vegetation**	**Minimum Practical Grazing Area** (Acres) **	**Maximum Practical Grazing Slope** (Percent %) (Wet Ground / Dry Ground)	**Maximum Density** (lbs per acre) (Wet Ground/Dry Ground) ***	**Grazing Season**	**Herd Type**
Goats	Browsing	0.2	Chaparral, Brush, Poison Oak, Weeds	0.15 AC	60% / 80%	15,000 lbs / 60,000 lbs	April - October	Seasonal/ Contracted
Sheep	Grazing	0.2	Oak Woodland/ Grassland, select weeds	0.15 AC	60% / 80%	15,000 lbs / 60,000 lbs	April - June	Seasonal/ Contracted
Cattle	Grazing	1.0	Oak Woodland/ Grassland	0.5 AC	50% / 70%	10,000 lbs / 50,000 lbs	Year Round	Resident

* ”Equivalent Animal Units” establishes a consistent unit factor to compare herd sizes; for example, a herd of 10 cows (1.0 AU) is equivalent to a herd of 50 goats (0.2 AU)
** The “Minimum Practical Grazing Area” is signfigantly dependent on herd size; these minimum practical grazing areas assume that herd sizes will remain equally small in order to accomodate efficient grazing in and around small spaces between buidlings and roads.
*** The “Maximum Density” is the maximum collective herd weight supported per grazeable acre

GOAT BROWSING

SHEEP GRAZING

CATTLE GRAZING

GRAZING

Animal husbandry will continue to be an important economic, management and aesthetic experience of the Guenoc Valley PROJECT. Cattle will continue to be rotated throughout the site within larger open and pasture areas and will be contained with permanent and temporary fencing as applicable. Sheep and goats will be used closer to development areas to aid in reducing vegetative cover and fire risk, as well as providing food and fiber for the Maha Farm.

VINEYARDS
MINIMALLY IMPACTFUL GRAZING (I.E. SHEEP GRAZING) ALLOWED IN SELECT VINEYARDS WITH AGREEMENT FROM PROPERTY OWNERS OR MANAGERS

RESIDENTIAL AND COMMERCIAL LANDCAPES

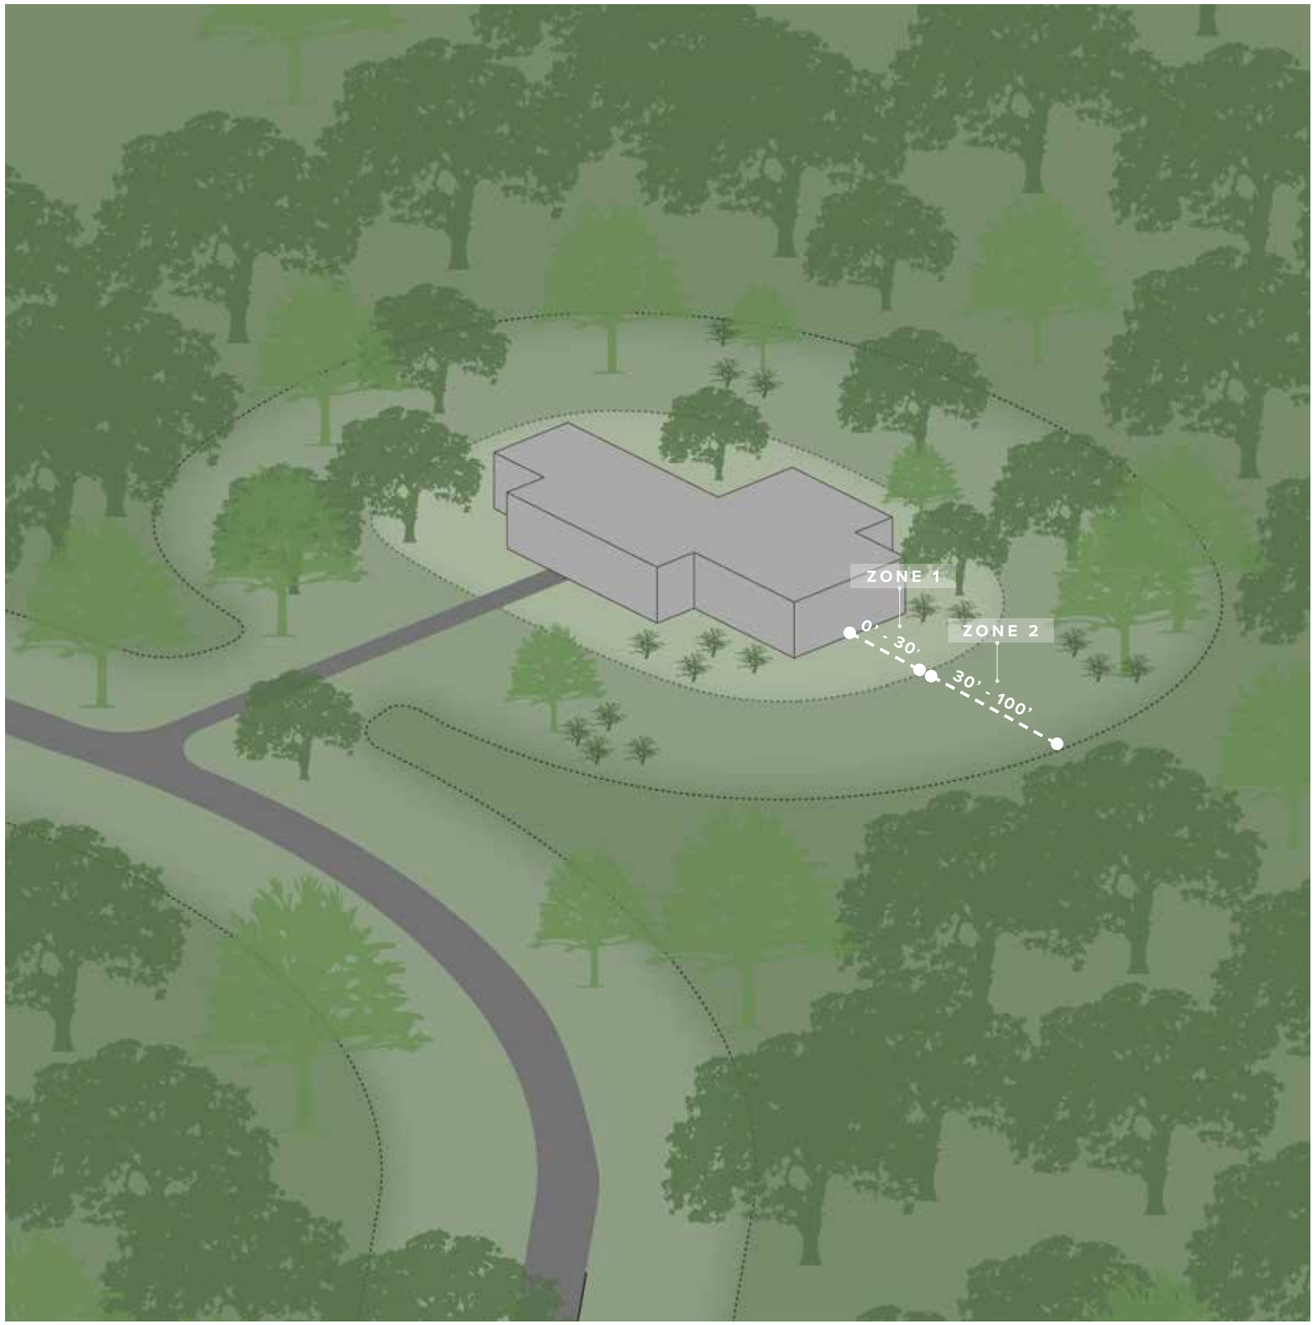
LANDSCAPE FIRE PLAN

The site is located in a high fire hazard area as classified by the California Department of Forestry and Fire Protection (CDF). Development in wildland hazard areas is required to meet safety and design standards. Measures beyond the minimum fire safety regulations have been proposed by the development to ensure adequate access, fuel breaks, temporary areas of refuge and vegetation management, such as the construction of an on-site emergency fire center and helipad for emergency access/transportation. Multiple on-site water sources are available for fire suppression and will be supplemented, in architectural clusters, with fire hydrants for first responders. Extensive fire management plans and fire mitigation strategies are outlined in the Guenoc Valley Emergency Action and Fire Management Plan.

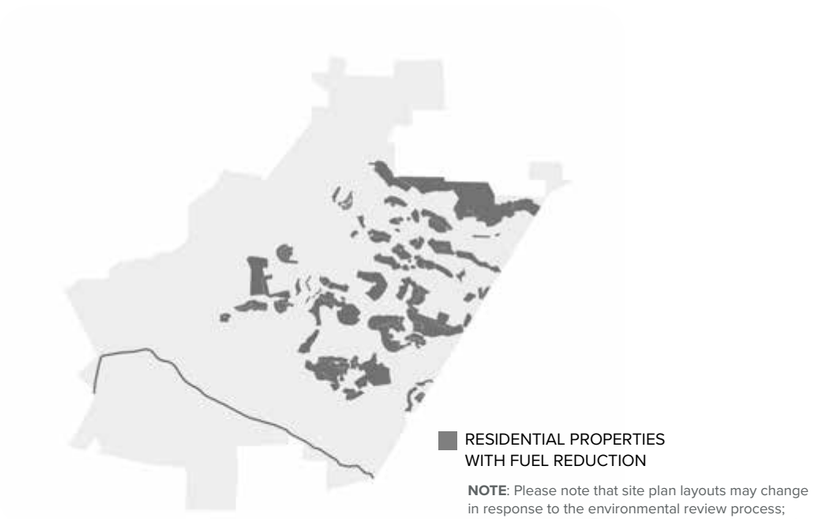
A development of this size and expense requires all measures possible to protect and preserve the environment, buildings and longevity of the landscape. It is in the best interest of both the long-term viability of the PROJECT and the County to plan for wildfire risk and to actively manage the landscape to reduce the risks as well as to plan for first responder access and emergency response plans to ensure and improve public safety. With careful planning and maintenance of defensible space the PROJECT is offering 27 miles of fuel breaks through the entire PROJECT. This is possible due to the commitment the PROJECT has made that all two-lane roads will be maintained with a 50-foot buffer on each side, resulting in continued site-wide fuel breaks.

In anticipation of the high level of vegetation and fuel management and maintenance of buffer zones, the greatest fire threat will often be an exterior threat. In an effort to mitigate exterior threats, on-site dozers will be available for emergency fire digging, to be utilized by approval of Cal Fire. Additionally, measures such as an on-site emergency response center and on-site all terrain response vehicles will be available for first responders.

RESIDENTIAL TYPICAL FUEL REDUCTION STRATEGY



RESIDENTIAL PROPERTY LOCATIONS



RESIDENTIAL PROPERTIES WITH FUEL REDUCTION

NOTE: Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

RESIDENTIAL FUEL REDUCTION ZONES

All residential properties will follow common fuel reduction strategies established by Public Resource Code (PRC) Section 4291. This involves creating and maintaining a defensible property in the fire management strategies described below.

BUILDING CONSTRUCT TO WILDLAND-URBAN INTERFACE (WUI) BUILDING CODES

Buildings will be constructed using materials that resist ignition or sustained burning when exposed to embers and small flames from wildfire. Exterior fire sprinkler systems will be installed on all buildings with independent water connections.

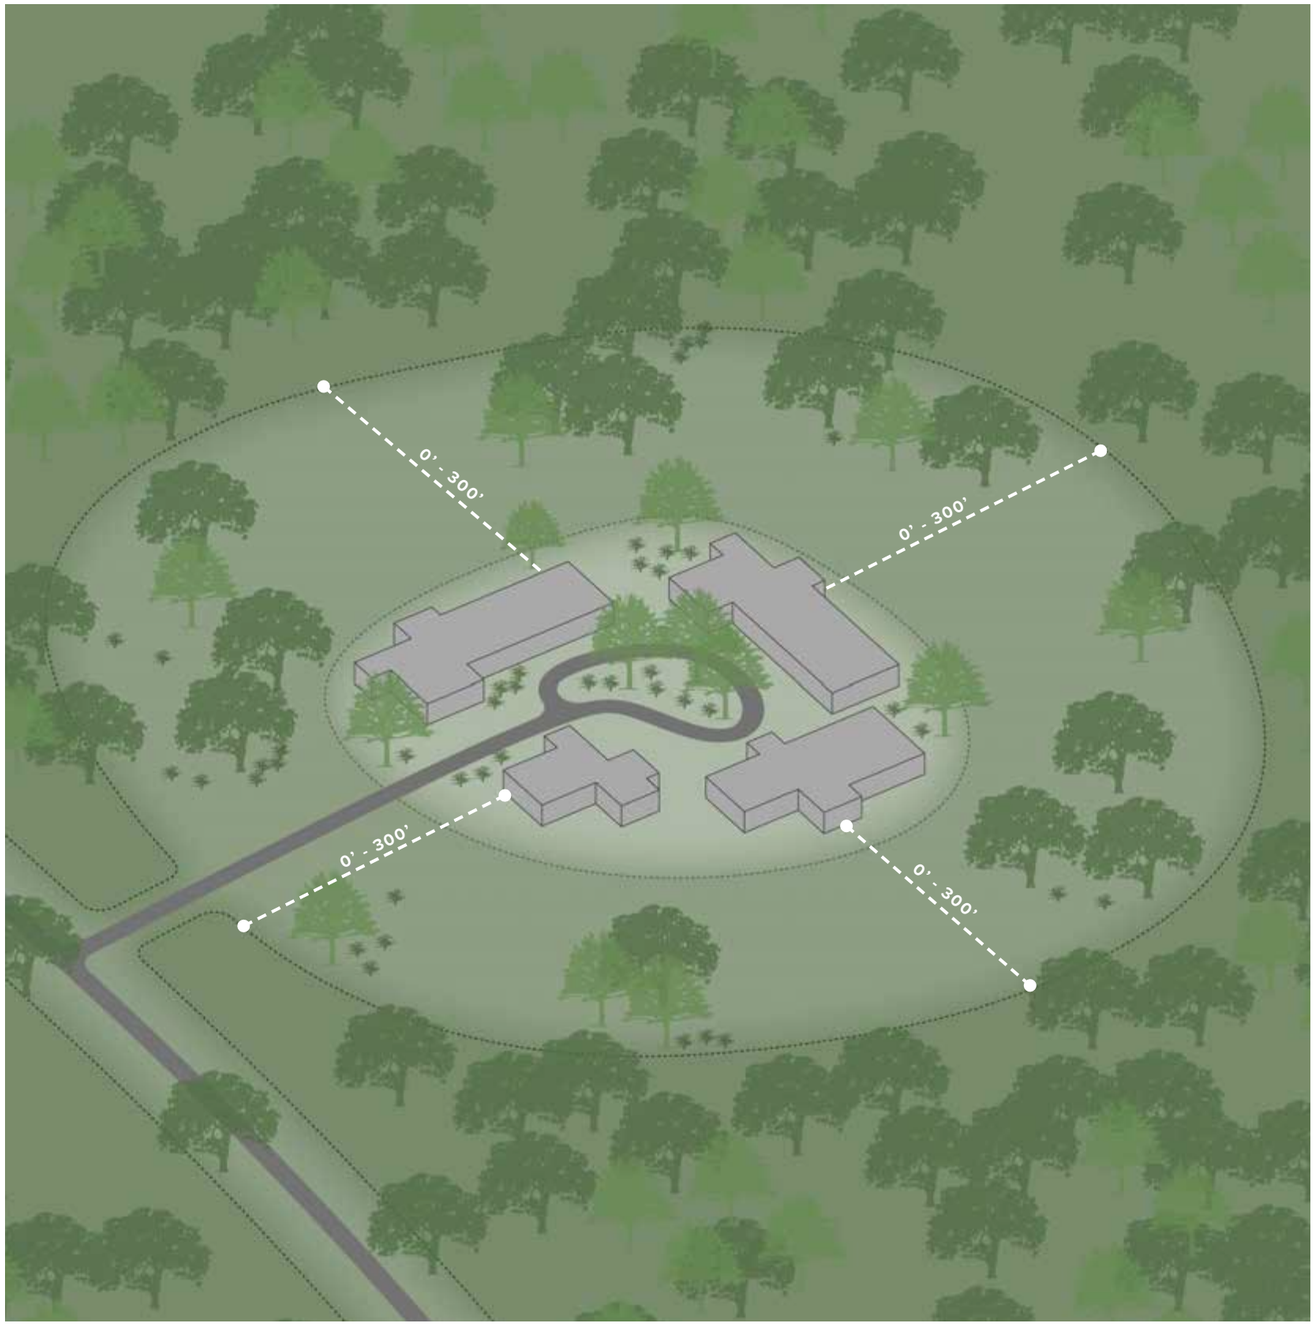
ZONE 1 REMOVE FLAMMABLE VEGETATION
0' - 30' FROM EDGE OF BUILDING

Within this zone, fire-prone vegetation will be eliminated. This includes removing all dead vegetation and removing or adequately pruning flammable shrub species. Trees will generally be pruned up to a height of 10 feet depending on species and understory conditions, with tree crowns and shrubs adequately separated to prevent fires from spreading.

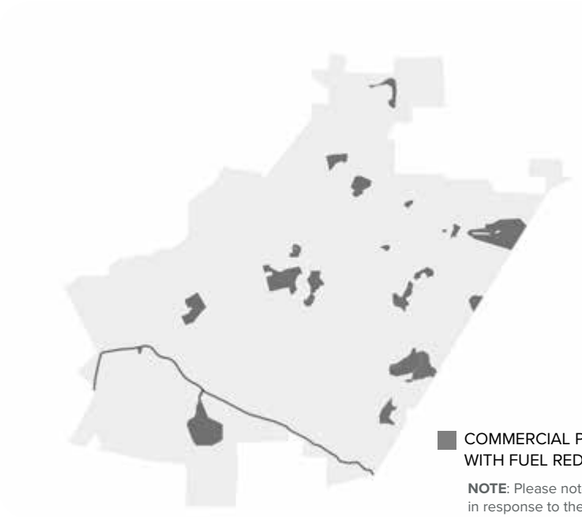
ZONE 2 REDUCE FLAMMABLE VEGETATION
30' - 100' FROM EDGE OF BUILDING

Within this zone, fire-prone vegetation will be reduced. This could include pruning branches from trees, cutting dead wood from shrubs, and mowing dried grass. In addition, individual trees or tree clusters will be adequately spaced to prevent fires from quickly spreading.

COMMERCIAL TYPICAL FUEL REDUCTION STRATEGY



COMMERCIAL PROPERTY LOCATIONS



COMMERCIAL PROPERTIES WITH FUEL REDUCTION

NOTE: Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

COMMERCIAL FUEL REDUCTION ZONES

All commercial buildings—including major hotel and restaurant buildings as well as supporting amenities, such as back-of-house operational buildings—will reduce and selectively remove fire-prone vegetation within 300' from the edge of the building. This strategy is in compliance with regulations applied to commercial buildings by the Certified Unified Program Agencies (CUPA) program, as overseen by the California Environmental Protection Agency (CalEPA).

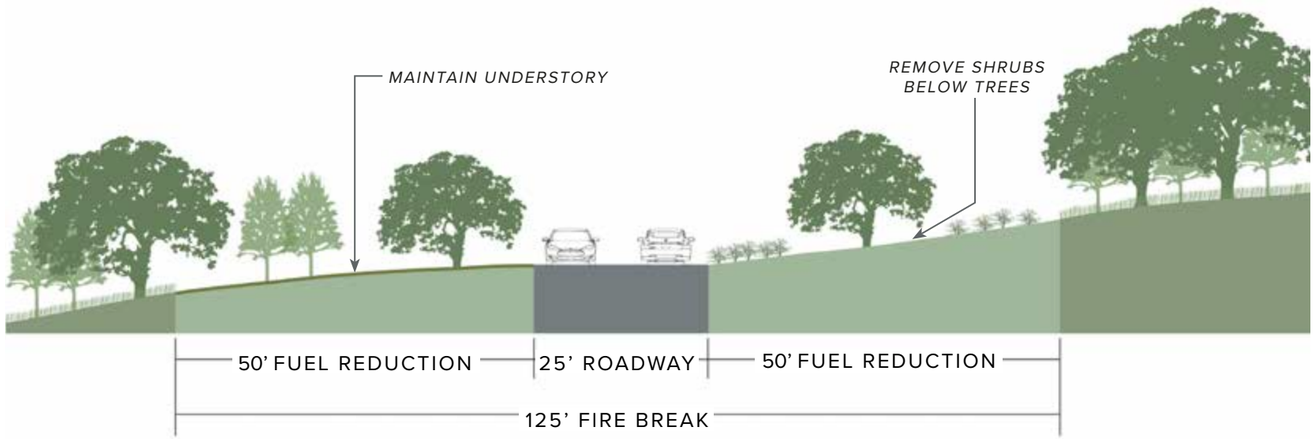
BUILDING CONSTRUCT TO WILDLAND-URBAN INTERFACE (WUI) BUILDING CODES

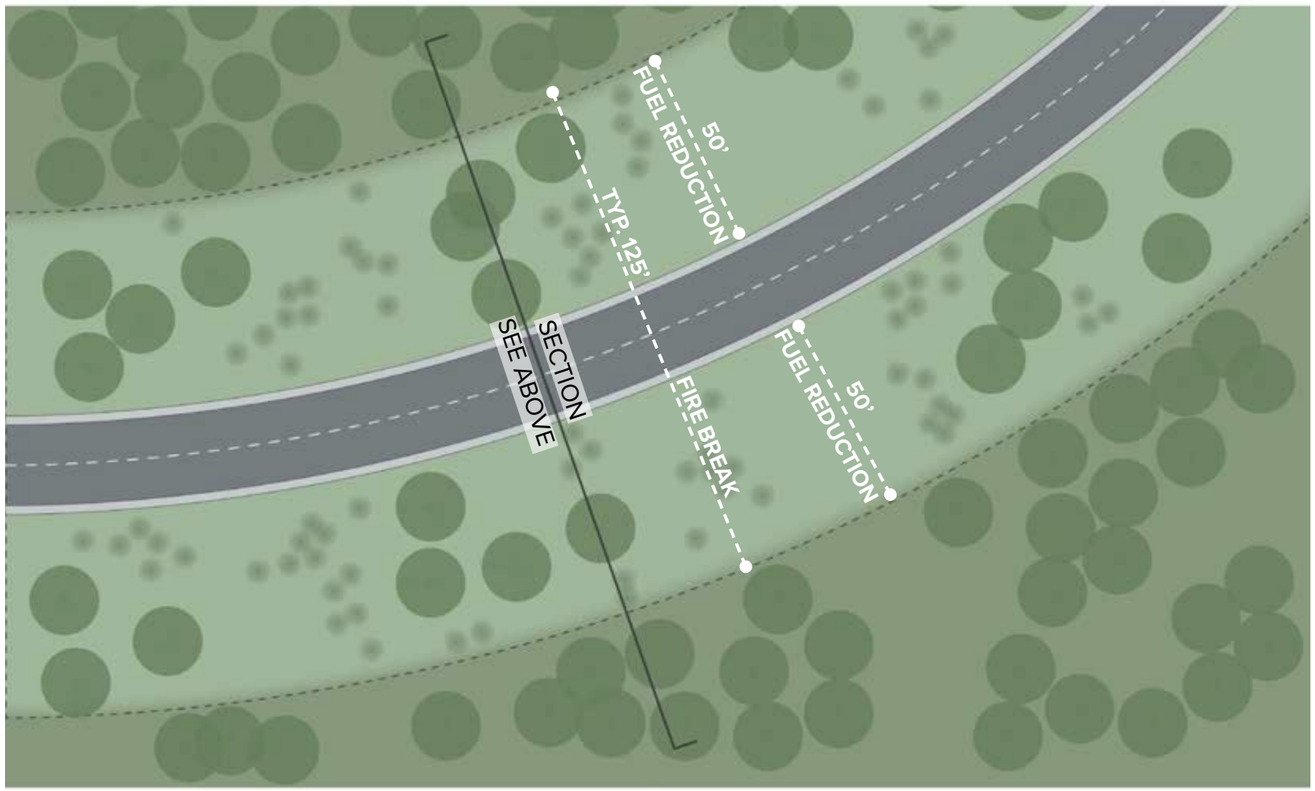
Buildings will be constructed using materials that resist ignition or sustained burning when exposed to embers and small flames from wildfire. Exterior fire sprinkler systems will be installed on all buildings with independent water connections.

FUEL REDUCTION ZONE REMOVE AND REDUCE FLAMMABLE VEGETATION
0' - 300' FROM EDGE OF BUILDING

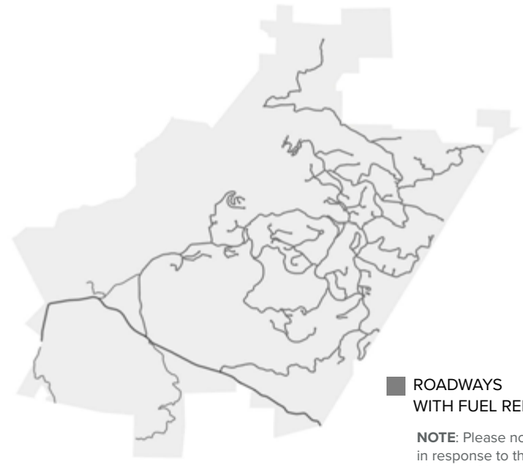
Within 300' from the edge of the building, fire-prone vegetation will be removed and reduced. This includes removing all dead vegetation and selectively removing flammable shrubs. Additional actions include pruning lower branches from trees, cutting dead wood from shrubs, and mowing dried grass. In addition, individual trees or tree clusters will be adequately spaced to prevent fires from quickly spreading.

ROADWAY TYPICAL FUEL REDUCTION & FIRE BREAK STRATEGY





ROADWAY ROUTES



ROADWAYS WITH FUEL REDUCTION

NOTE: Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

ROADWAY FUEL REDUCTION ZONES & FIRE BREAKS

Flammable vegetation will be reduced and removed within the first 50' from both edges of roadways. This strategy will create a network of fire breaks throughout the property and ensure navigable access and evacuation routes in the case of an emergency.

FUEL REDUCTION ZONE REMOVE AND REDUCE FLAMMABLE VEGETATION
0' - 50' FROM BOTH ROADWAY EDGES

Within the first 50' from the edge of the road, fire-prone vegetation will be removed and reduced. This includes cutting down dead trees and removing all flammable shrubs. The understory below trees will be maintained by mowing, grazing, and manual vegetation removal; in addition, shrubs will be removed below trees. Within this zone, individual trees or tree clusters will be adequately spaced to prevent fires from quickly spreading.

LANDSCAPE FIRE MANAGEMENT SITE PLAN

As detailed below, a variety of actions and strategies will be deployed in order to address fire concerns throughout the site. Grazing, manual vegetation removal, and irrigation will be used throughout the site's common, residential, and commercial landscapes to reduce fire risk. A network of fire breaks will be formed through a system of roadways, vineyards, and recreation fields; in addition, a property boundary fire break will also be maintained to further reduce the risk of fires from entering the site. In the case of a fire, a series of temporary refuge areas and emergency access roads will be essential in ensuring safety for residents and access for emergency personnel. A detailed fire management plan will be submitted under a separate cover

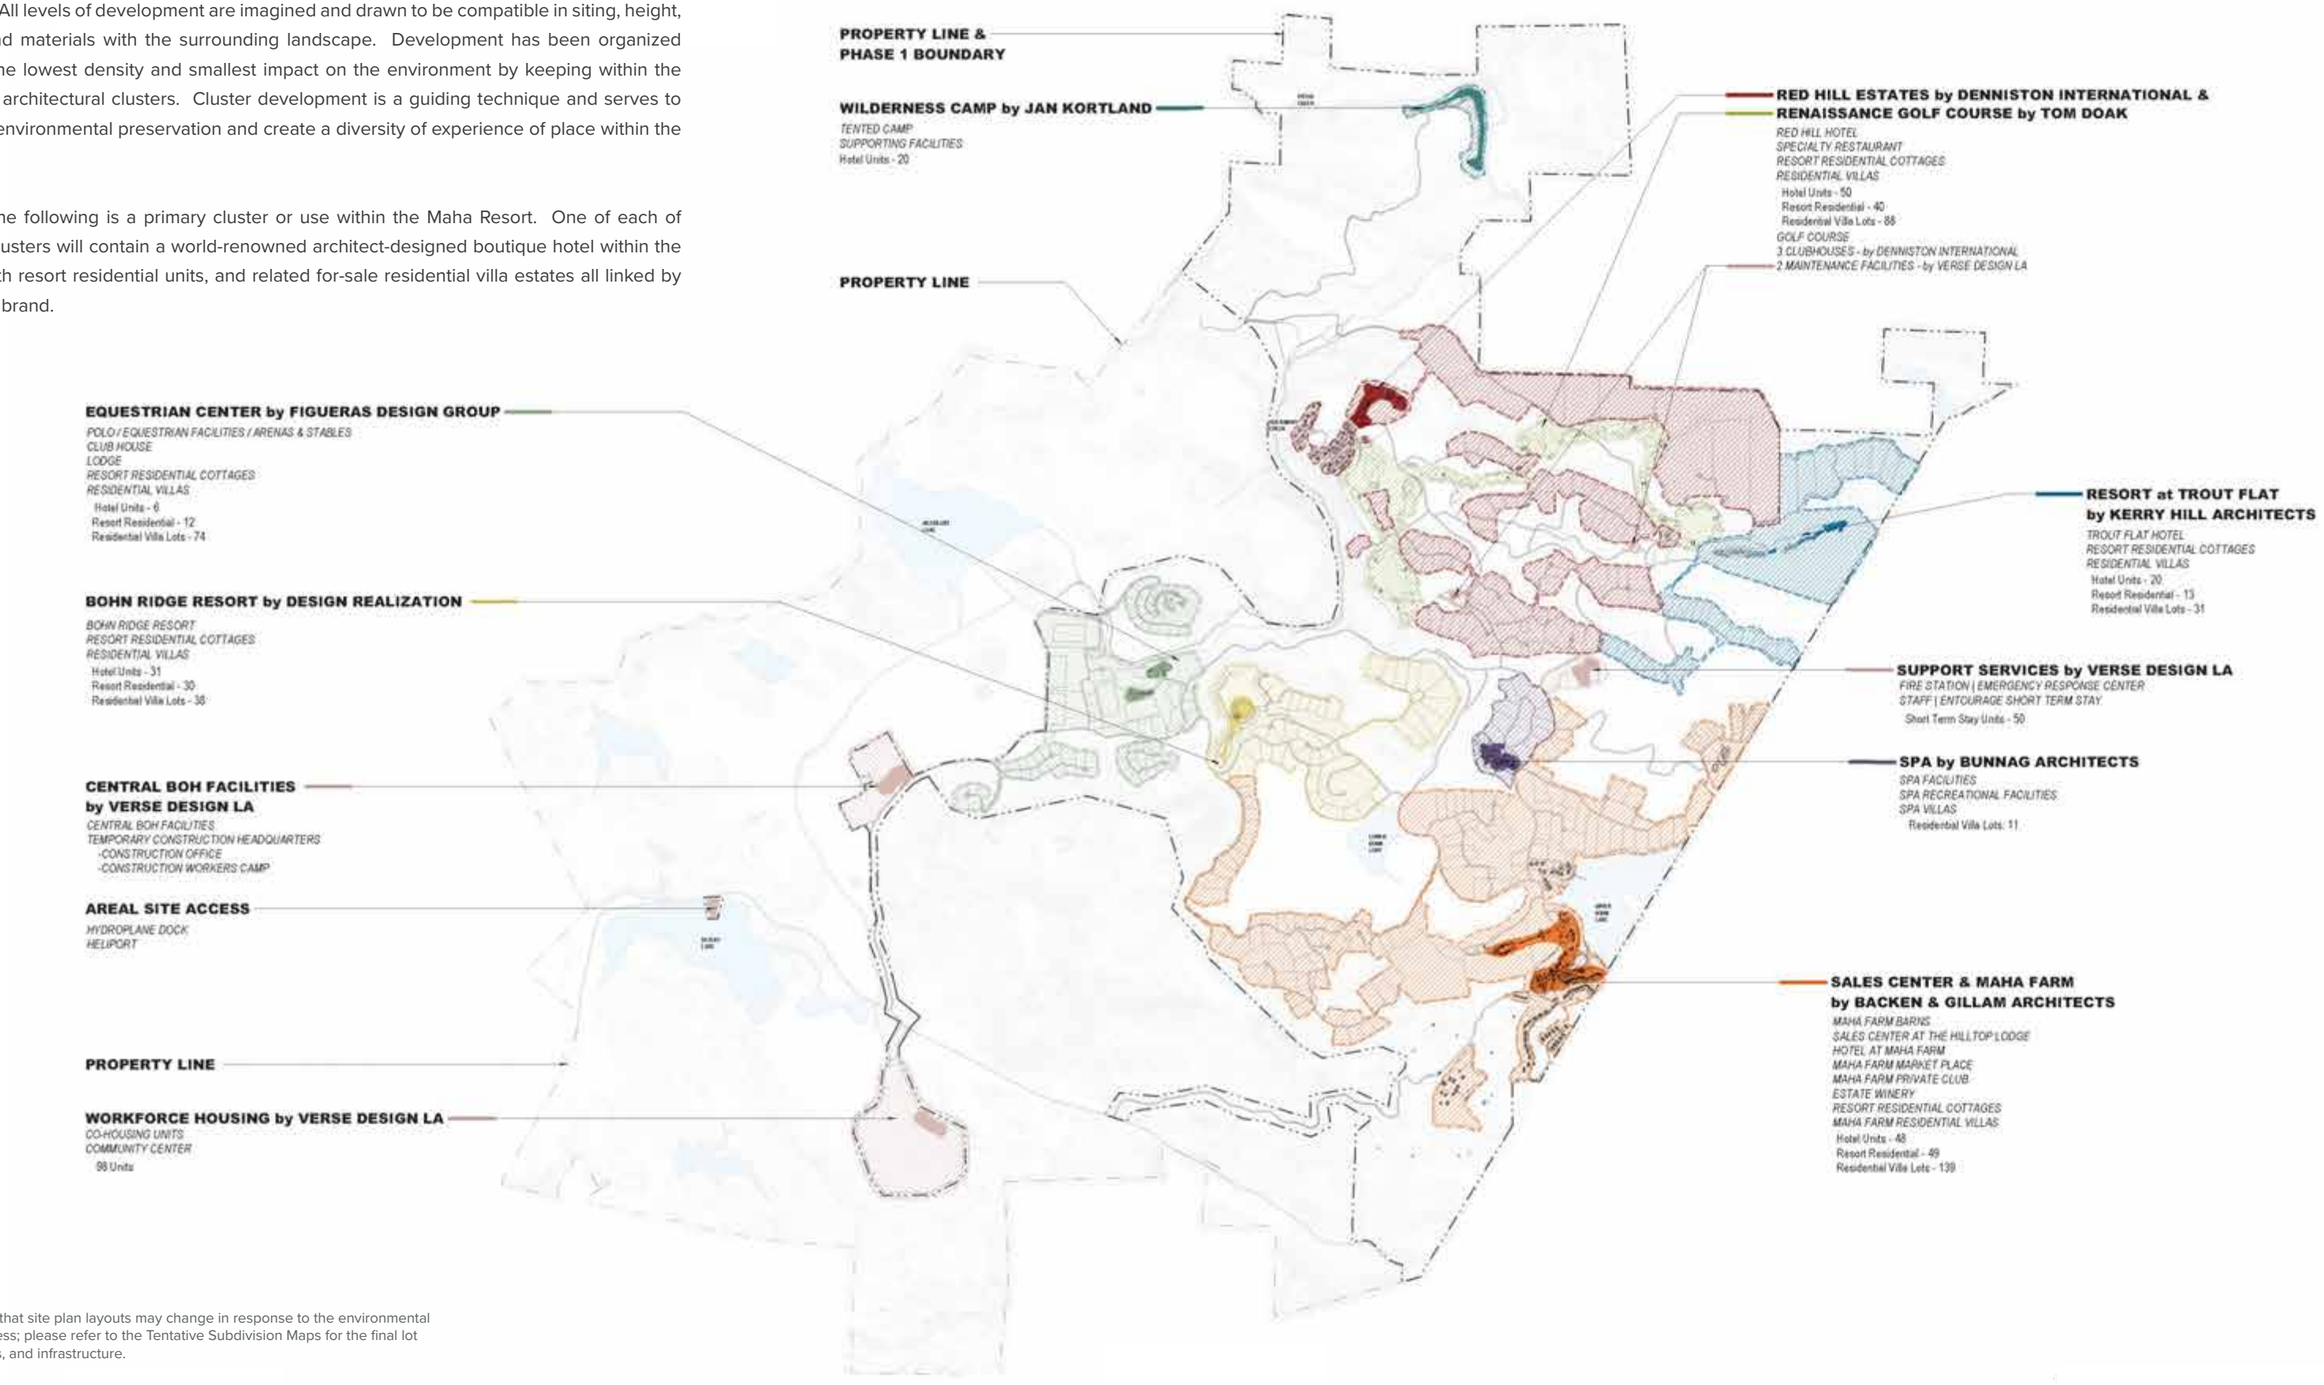
SECTION 3 ARCHITECTURE AND LAND USE PLANS

ARCHITECTURE AND LAND USE PLANS

Inspired by the existing beauty of the surrounding landscape, the architectural clusters of the Maha Resort, responding to the potential of each site, have been designed in response to the land. All levels of development are imagined and drawn to be compatible in siting, height, colors, and materials with the surrounding landscape. Development has been organized to have the lowest density and smallest impact on the environment by keeping within the identified architectural clusters. Cluster development is a guiding technique and serves to promote environmental preservation and create a diversity of experience of place within the Property.

Each of the following is a primary cluster or use within the Maha Resort. One of each of the five clusters will contain a world-renowned architect-designed boutique hotel within the resort, with resort residential units, and related for-sale residential villa estates all linked by the Maha brand.

ARCHITECTURAL CLUSTER MAP



NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

Maha Farm—Backen & Gillam Architects

The Maha Farm is anticipated to be the heart of Maha. The Farm is located near Upper Bohn Lake and designed in response to the naturally occurring terrain. The highest elevation of each building is one story high, even in instances where elevation is incorporated to create a two-story building accessed at grade on each level.

The Maha Farm connects visitors to the Winery, Private Club and Sales Center. Within this area locally grown foods will be promoted and showcased in gardens within and surrounding the commercial center. This is anticipated to be a hub for events, farmers markets and commercial activities such as restaurants and retail as well as artisan market experiences.

0' 125' 250' 500'

Equestrian–Figueras Design Group

Redesigning a historical use within the Guenoc Valley required a respectful and honest dialogue between the current and proposed architecture to include world class equestrian facilities and stables as well as the Lodge for social activities. The equestrian area will be centered on the element of water. The buildings will blend with the landscape through implementation of green roofs that imply buildings as an extension of the landscape. The natural materials of stone, concrete, and wood will create a restrained aesthetic expression.

DESCRIPTION

The Equestrian Lodge, with its cantilevered concrete structure, will give the visitors the feeling of floating above the Guenoc Valley. It's strategic location on the top of the mountain will provide a bird's eye view of the entire Equestrian Center blending with nature.

Entering the building, guests will be struck by the spectacular mountain and lake vistas that fluctuate seasonally. The predominance of local wood and stone will provide warmth and rusticity to the modern spaces. The intention is to make the guests feel immersed in a retreat nestled in the mountains. The planted roof terrace opens to the soft winds and invites one to stop for a refreshment and dive into the infinity pool overlooking McCreary Lake. The lower level holds the most private and sheltered areas of the building. It's courtyard garden, carved into the mountain slope, gives light and tranquility to the guest room areas. Each bedroom opens to the dramatic views of the surrounding landscape.

NOTE

DESCRIPTION

The Clubhouse, the heart of the Equestrian Center, is strategically located between the main polo field and the new projected lake. The building is conceived with two main perpendicular wings. One parallel to the central polo field and the other extending towards the lake. Including large windows with spectacular views towards the natural landscape, stunning planted roofs, and internal patios will enhance the experience of living in such a magnificent environment

Members will enjoy drinks or lunch while watching a polo match from the restaurant and the terraces that over-look the field. They will also be able to stop at the exclusive tack shop to purchase riding apparel and equipment. Centrally located is the club's office where guests can get assistance booking a polo practice or a riding class.

After competition polo players and riders will be able to have a drink and socialize at the bar, take a massage at the spa, or shower and change in the wooden lined locker rooms. Adult members will also enjoy a garden roof terrace with a singular infinity pool and bar lounge while unwinding and watching polo games. On the north wing, families will be able to relax and gather around the swimming pool or the restaurant overlooking the lake and mountains

NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

Red Hill Estates - Denniston International

Guests arrive at a lower level and are introduced to the landscape which they will traverse in a curated procession to the Main Lodge. Amenities such as a lounge, bar, dining room, library, and boutique occur under one roof at the Main Lodge. Derived from local Native American dwellings, the round shape allows for maximum views from its circumference and takes advantage of the resulting internal courtyard, which offers a prime location for special dinners and events.

DESCRIPTION

The design aims to provide to all guest and visitors a close to nature and elements experience, but in a conformable and secure environment. Already the wandering roads through the resort to the several hotel components is an experience of nature and wildlife, with unobstructed views and a feeling of freedom. Only in close proximity the buildings smoothly reveal themselves as elements that belong to their surroundings, giving the impression that they have always been there. When entering the building, the guest should feel a change of scenery, however still seamlessly connected to nature, with framed and controlled views of the landscape, dramatic experience of levels, as well as discovering micro environments inside always just one step away from the door or window.

Renaissance Golf Course - Tom Doak

The design of these buildings aims to create harmony with the natural context through the implementation of materials, finishes and careful detailing that carry on the architectural language set forth by the Main Lodge. The first and 18th Golf Clubhouses integrate lounge, bar and dining areas for the use of its members. The clubhouse at the ninth hole is highlighted by sculptural landscape and integrated building form creating a unique event space with views along the cliff line.

The Golf Maintenance buildings, while housing utilitarian and practical support aspects, will reflect the homestead feel of the main back of house program.

Bohn Ridge Resort - Design Realization

Before the vast beauty of Bohn Ridge and its panoramic views, this architectural cluster adopts the simplicity of barn architecture in shapes, volumes, and the intermingled juxtaposition between indoor and outdoor living spaces. Building footprints are scaled according to the existing geological footprints, minimizing the built form in respect to the site. Low-lying residential resort structures with pitched roofs, planted roofs and stone paved terraces will complement the site.

DESCRIPTION

Our approach is to blend with the site and allow the guests to experience a place where interior and exterior spaces are well integrated, either public or private.

Bohn Ridge Resort is composed of 1 and 2 bedrooms which are snuggled into a beautiful natural landscape following the levels of the terrain, located around a central element which is the core of the hotel and offers 360 degrees sweeping views. The buildings seem to grow out of the hillside in a monolithic way, emphasized by the choice of materials and colors, relating to the site. The various buildings openings onto terraces are the features which best define the essence of the project, ie: allowing the guests to feel part of the nature around. This is because of the natural beauty of the site, hills, trees, rock formations.

NOTE

Resort at Trout Flat - Kerry Hill Architects

A cluster of single story pavilions along the ridgeline will overlook vineyards on the Property. Inspired by the concept of a low-impact eco-lodge, the plan positions each building according to existing contours to minimize disturbance to the terrain. Combining stone plinths and rammed earth walls, high ceilings extend the feeling of openness and transparency from the exterior landscape into the interior. This site is detailed by outdoor spaces, a lounge veranda, and dining terrace overlooking a reflection pool.

Spa - Bunnag Architects

The celebration of the cultural heritage, which inspired the Veranda and Courtyard, also informs the design of the Spa. The sense of interior and exterior spaces blend into one integrated space. Replacing the traditional concept of architecture defined by a singular space, the spa was designed to embrace both interior and exterior spaces.

DESCRIPTION
With an aim to harmonize our design interventions to the existing environment, we propose a variety of "pure geometrical form and space" as a series of "small pavilions" amongst landscape. This approach allows Architecture to be more adaptable and flexible to assimilate into the existing delicate environment. It is a soft-design-approach that we believe will ensure minimum disruptive impact to the timeless beauty of the Region's land and culture.

Supporting Facilities | Verse Design LA

The various hotel clusters will be supported by multiple facilities. Workforce housing is designed to be flexible depending on employee demographics. In addition, there is an opportunity for short term overnight stays for employees and guest staff. Most importantly, a strategically placed emergency response center includes a fire response center, emergency medical staff, and a helipad dedicated for emergency purposes. Lastly, for guests choosing to arrive via a float plane or helicopter there is a welcome kiosk and arrival center located conveniently accessed directly from Butts Canyon Road.

NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

0' 9000' 18000' 36000'
ORIGINAL SCALE: 1" = 1800'-0"

Workforce Housing*

Land and housing costs continue to rise in response to wildfires, economic trends over the past decade, and in particular the demand for housing. Housing, homeownership, and renting has become more expensive throughout Northern California and within the County of Lake. The majority of housing available within the County is limited. Infill housing is a means of providing new housing stock in an area already proximate to public infrastructure. In conjunction with the resort development within Guenoc Valley, The project proposes a mixture of on-and off-site workforce housing for employees. This development will blend into the surrounding area offering ranch-style farmhouse exteriors, maintaining quality architecture, and reflecting positively the surrounding neighborhoods and the character of Lake County.

*Note: A housing unit is defined as a 400 sq. foot bedroom and bathroom. Our proposal indicated workforce housing to be designed as co-living housing structures, built in single-family style residency, with accessory dwelling units. We are proposing 50 parcels to be located off-site at a previously subdivided parcel in Middletown and 35 parcels with residences on-site off of the west side of Butts Canyon Rd.

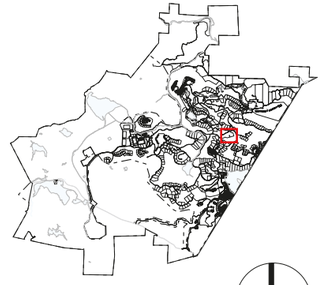
DESCRIPTION

The Emergency Center will continue the provincial and functional principles of the main back of house program, to facilitate the practical needs of the Emergency Center. The material palette will be integrated with the Back of House buildings throughout the site. The fire center will include a structure to house firefighting equipment, as well as a headquarters space in the case of emergency. It will also house minor medical supplies and a helipad location for emergency services.

Staff short term Housing, also referred to as, the Entourage Hotel, the design will reflect the barn vernacular used elsewhere to convey a sophisticated but restrained aesthetic with refined detailing and finishes. This, the most modest of hotels in the development, will serve event support personnel and guests and will echo The Project's characteristic respect for the land with thoughtful site placement and a minimal footprint. Communal spaces will orient to views of the rural landscape offering both indoor and outdoor resting space.



NOTE

Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

SECTION 4 SUBDIVISION PLANS

SUBDIVISION PLANS

The PROJECT proposes multiple tentative subdivision maps submitted under separate cover. The following sheets coorespond to the subdivision phasing and show the lot layouts for all new parcels. Please note these plans do not include the siting of construction and the area planned for conservation or easements. These plans depict accurate road layouts and parcel configurations; more detailed site analysis is included in the tentative subdivison application.

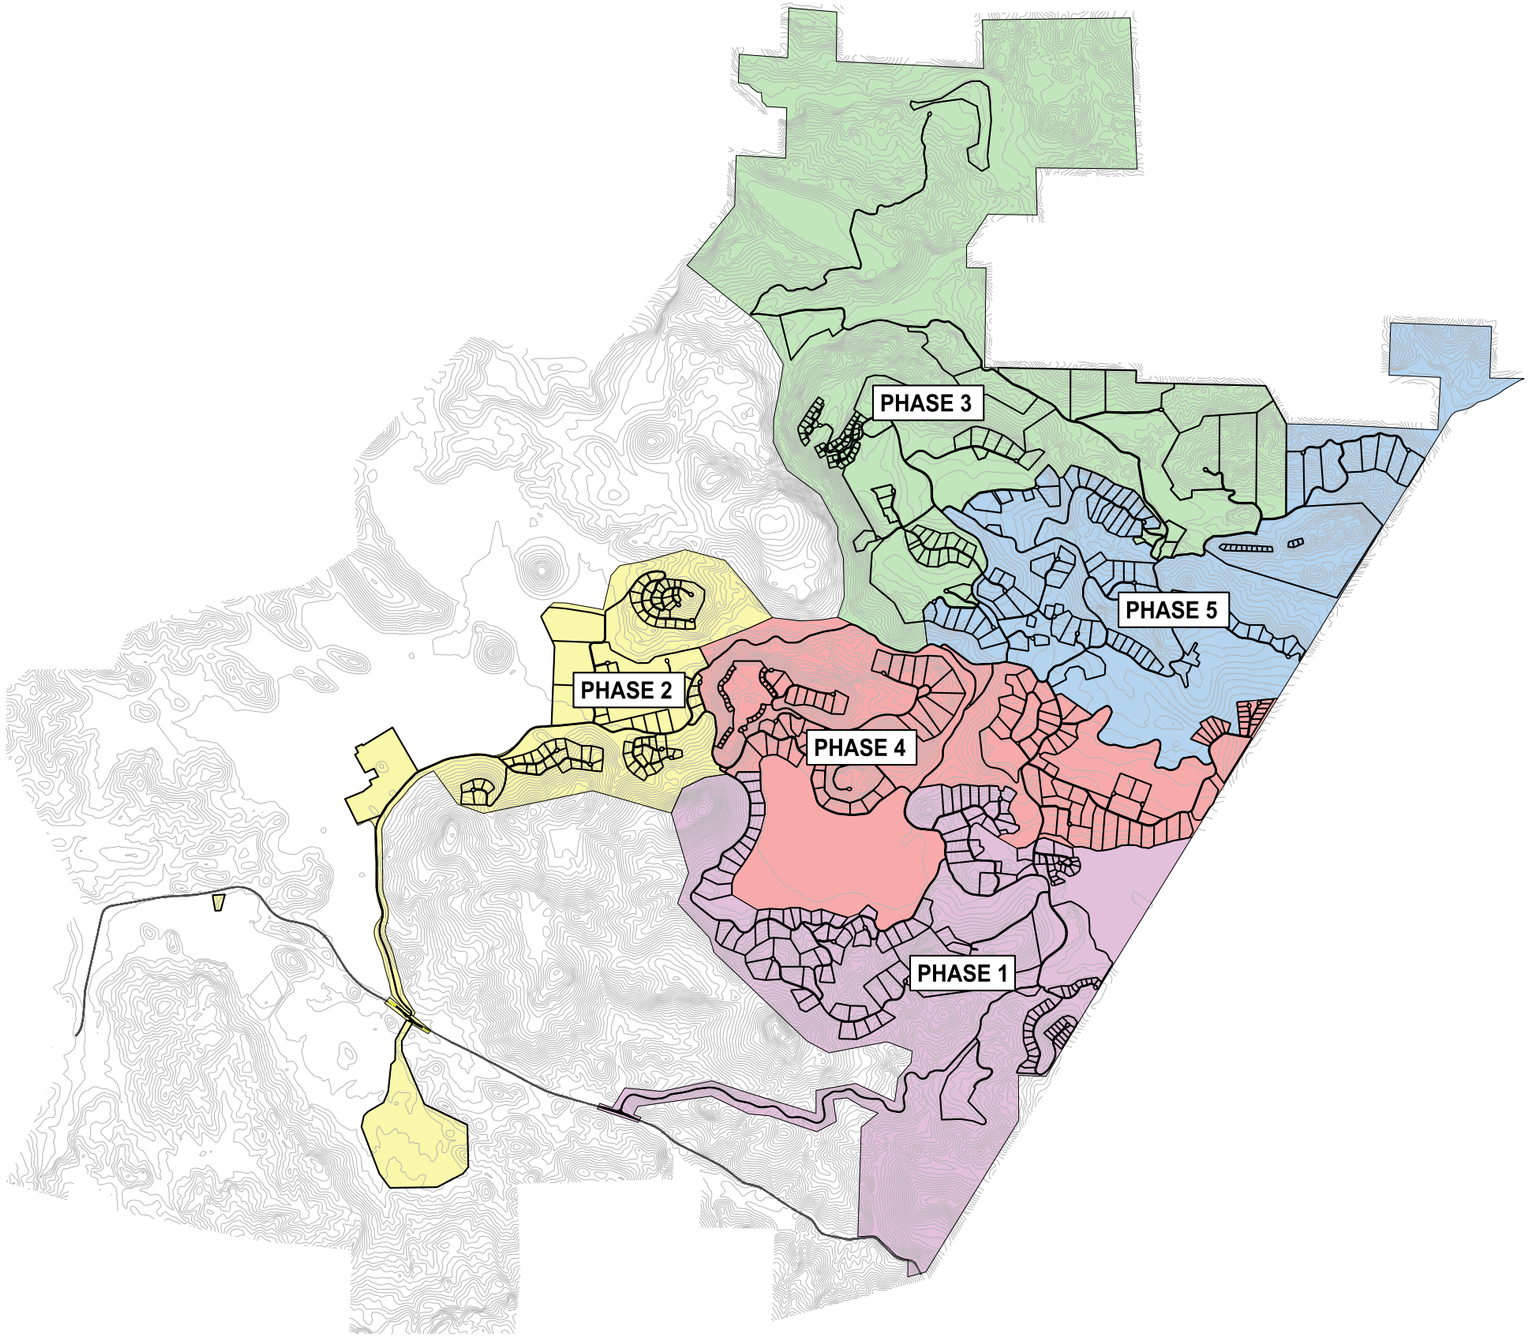
SECTION 5 UTILITIES & INFRASTRUCTURE



POTENTIAL DEVELOPMENT PHASING

IMPLEMENTATION AND PHASING

The first phase of construction will include primary resort facilities as well as supporting infrastructure such as roads, utilities and support services. This figure describes the most likely construction phasing. However, construction will be based on market demand.

NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

CIRCULATION

The circulation system for the first phase of the Proposed project would comprise a system of primary and secondary vehicular two-way roads and would serve as multimodal circulation routes providing shared access to standard vehicles, minor commercial delivery vehicles, emergency response vehicles, recreational vehicles and bicycles. Equestrian and pedestrian use would be accommodated separately via alternative pathways and trails.

A non-vehicular circulation system would comprise a system of off-road trails traversing more rugged terrain that would be developed for use with hiking, horseback, and mountain bike riding. Additionally, existing and proposed gravel and fire roads would be utilized and maintained for landscape fuel reduction, corridors for moving grazing animals, and wildland fire protection.

Primary access to the project site is from Butts Canyon Road. A new entrance for resident and guest access would be located at a designated site along Butts Canyon Road. All new intersections would include turning lanes and deceleration/acceleration lanes as needed. A traffic study is currently under way that will outline further improvements to the intersections/entrances (signalization, stop signs, traffic-calming measures, etc.). Additionally, air transportation/arrival will be provided via a guest helipad and a float plane dock, with kiosk and internal transportation services, to be constructed on Guenoc Lake at Detert Reservoir. Additionally, an emergency heliport will be centrally located at the on-site Emergency Response Center.

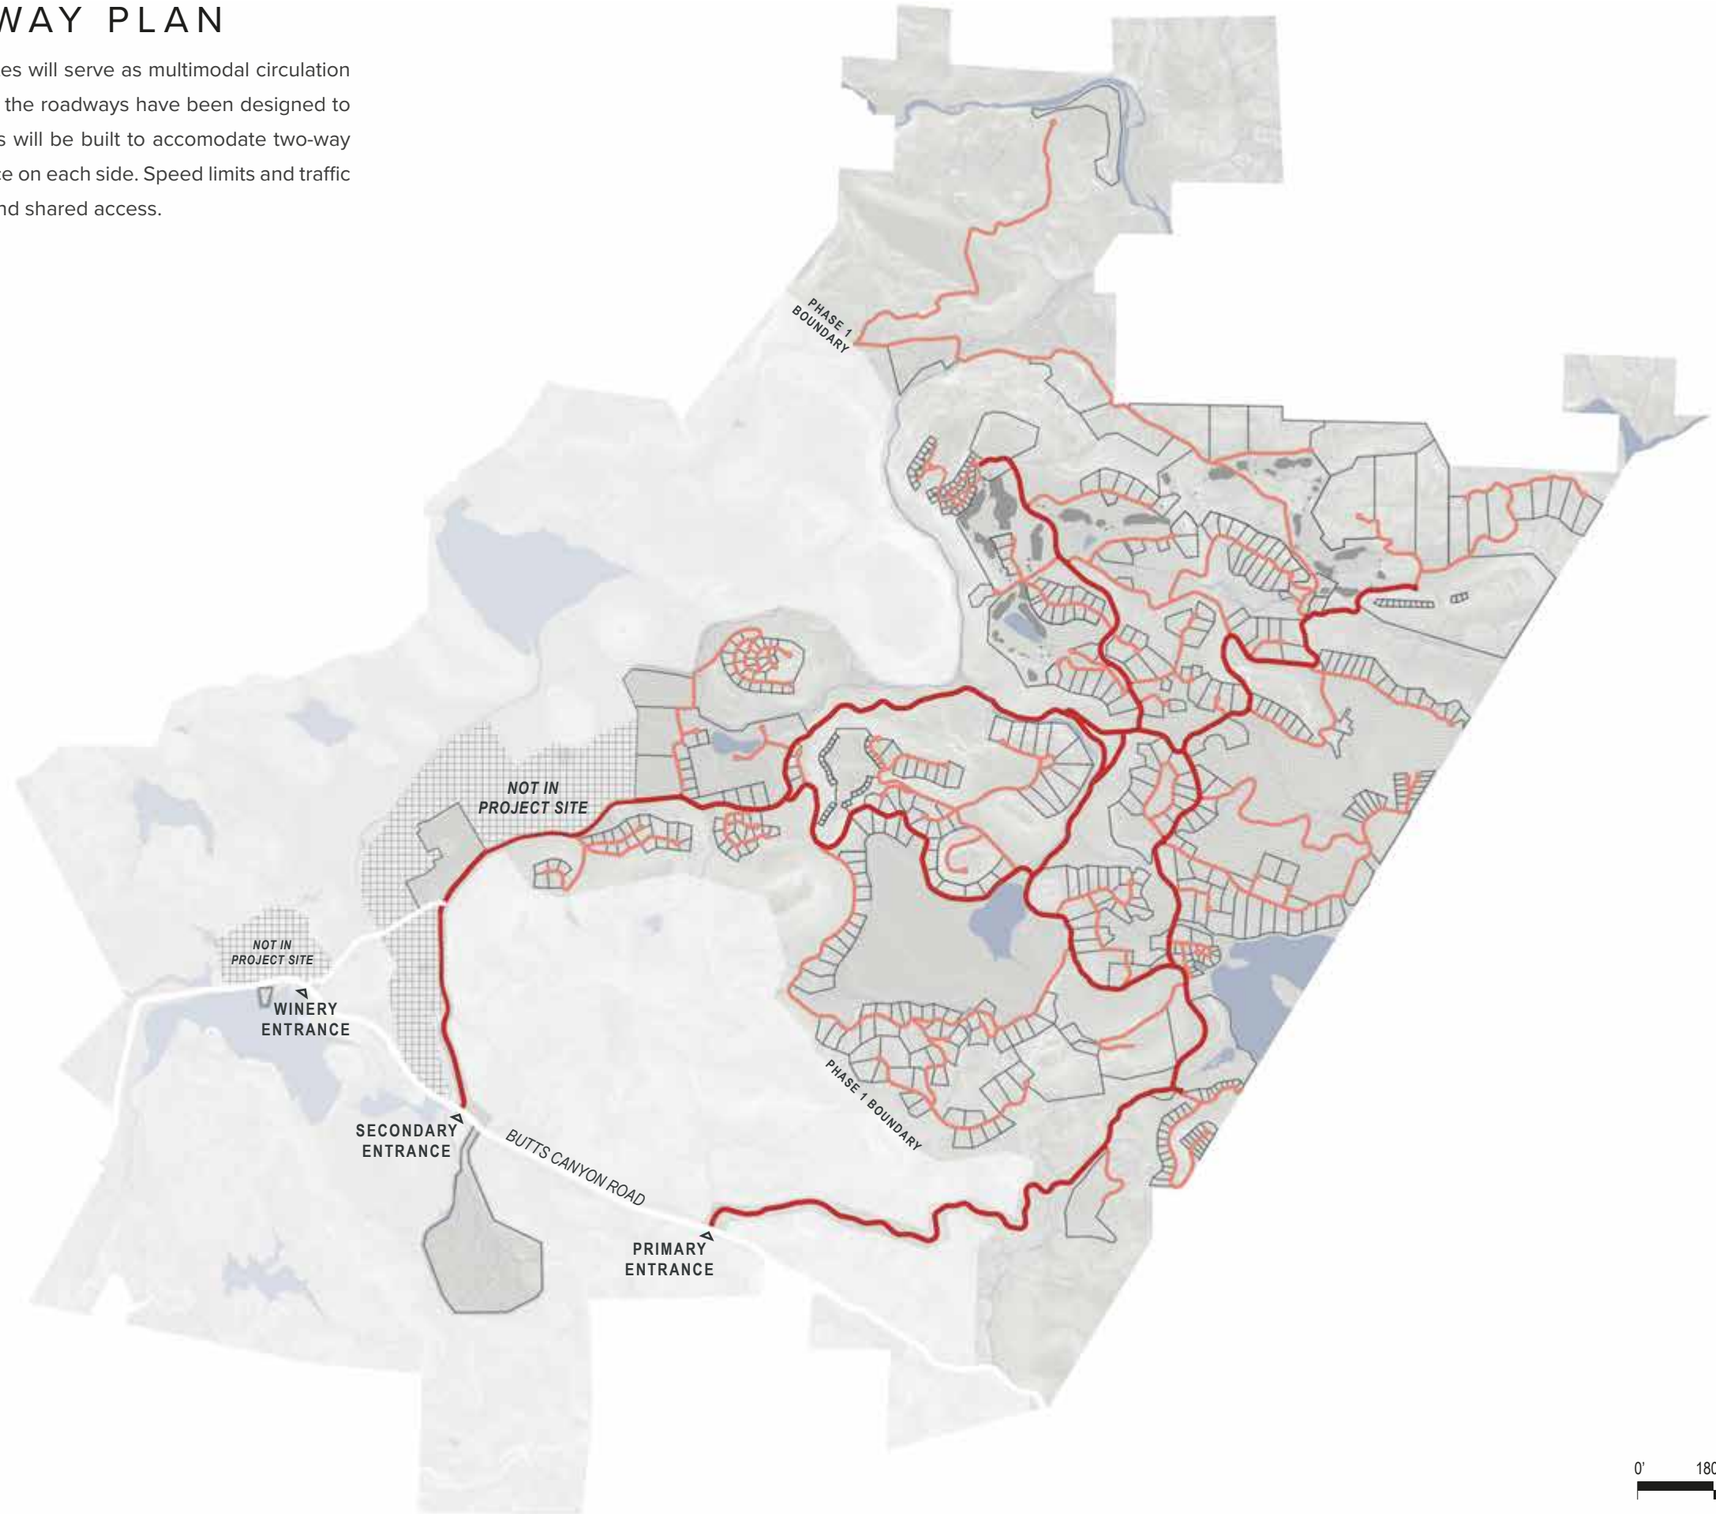
The existing intersection at Guenoc Road would be primarily used by staff and deliveries. A further access point would also extend from the proposed back of house facility westward along Butts Canyon Road, adjacent to Detert Reservoir, to converge with Guenoc Road and then run westward toward the Phase I project. At each of these two intersection locations, traffic and circulation improvements on Butts Canyon Road would be incorporated for improved safety, pending further traffic analysis.

CIRCULATION ROADWAY PLAN

The primary and secondary vehicular circulation routes will serve as multimodal circulation routes to provide access for standard vehicles. All of the roadways have been designed to be sensitive to the existing natural terrain. The roads will be built to accomodate two-way traffic lanes with a maintained 50 feet defensible space on each side. Speed limits and traffic calming techniques will be relied on to ensure safe and shared access.

PRIMARY ROADWAYS

SECONDARY ROADWAYS



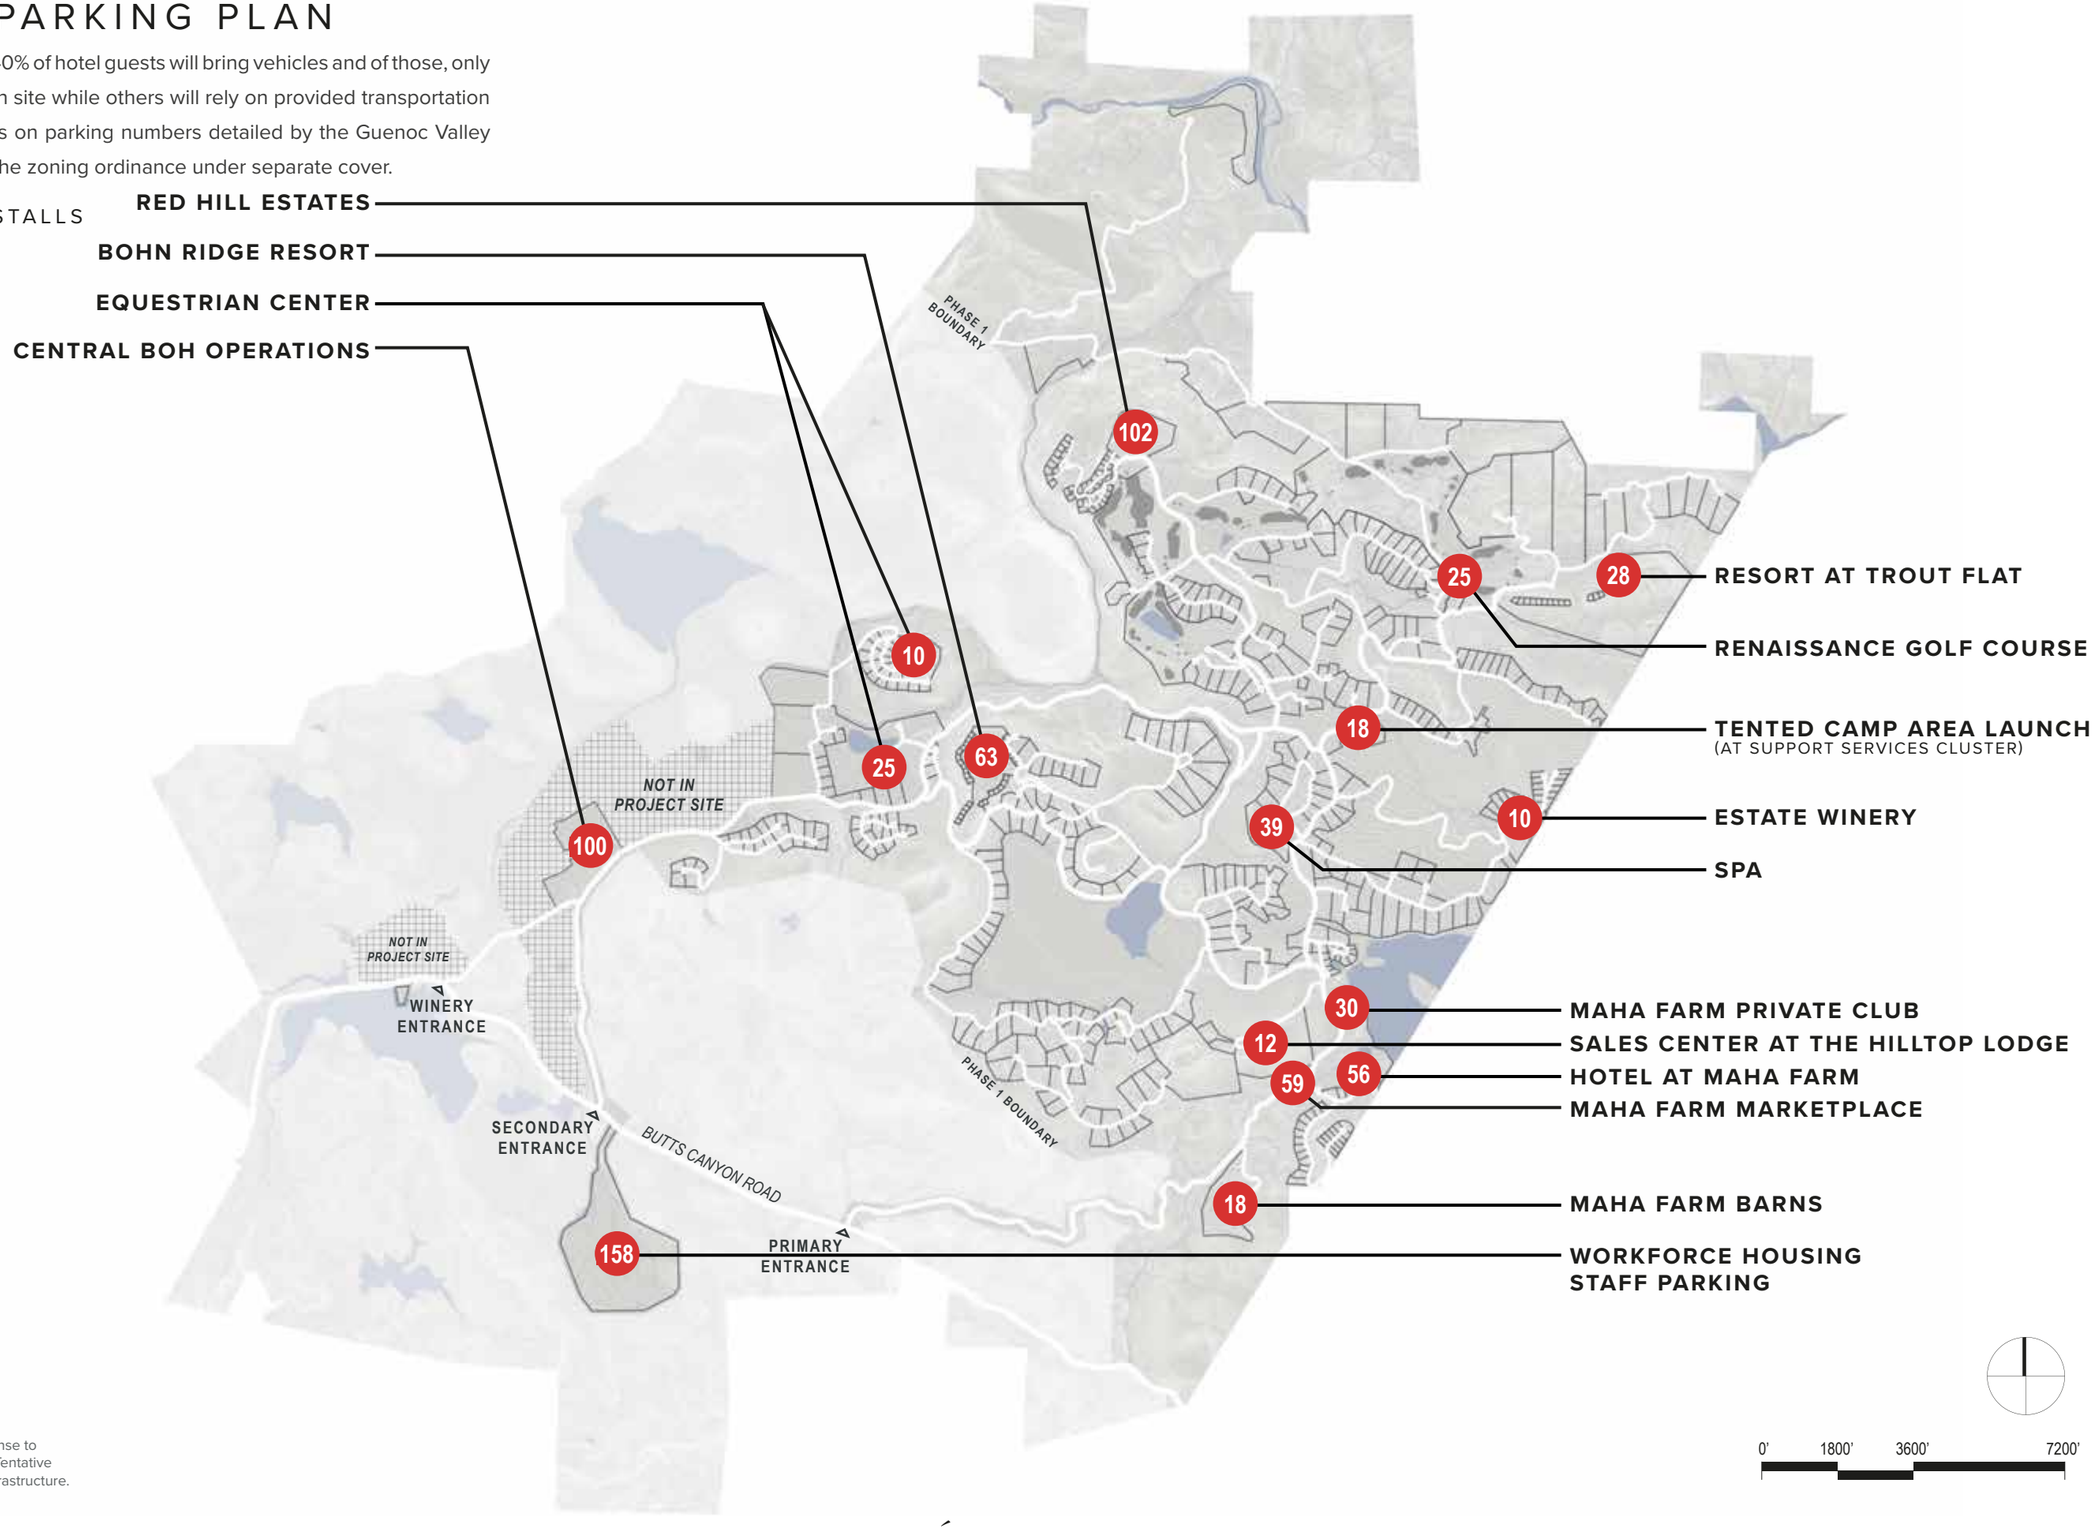
0’ 1800’ 3600’ 7200’

NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

CIRCULATION PARKING PLAN

Based on commensurate resorts, only 40% of hotel guests will bring vehicles and of those, only half will choose to use their vehicles on site while others will rely on provided transportation services. Therefore, the property relies on parking numbers detailed by the Guenoc Valley District parking code, as described in the zoning ordinance under separate cover.

NUMBER OF PARKING STALLS

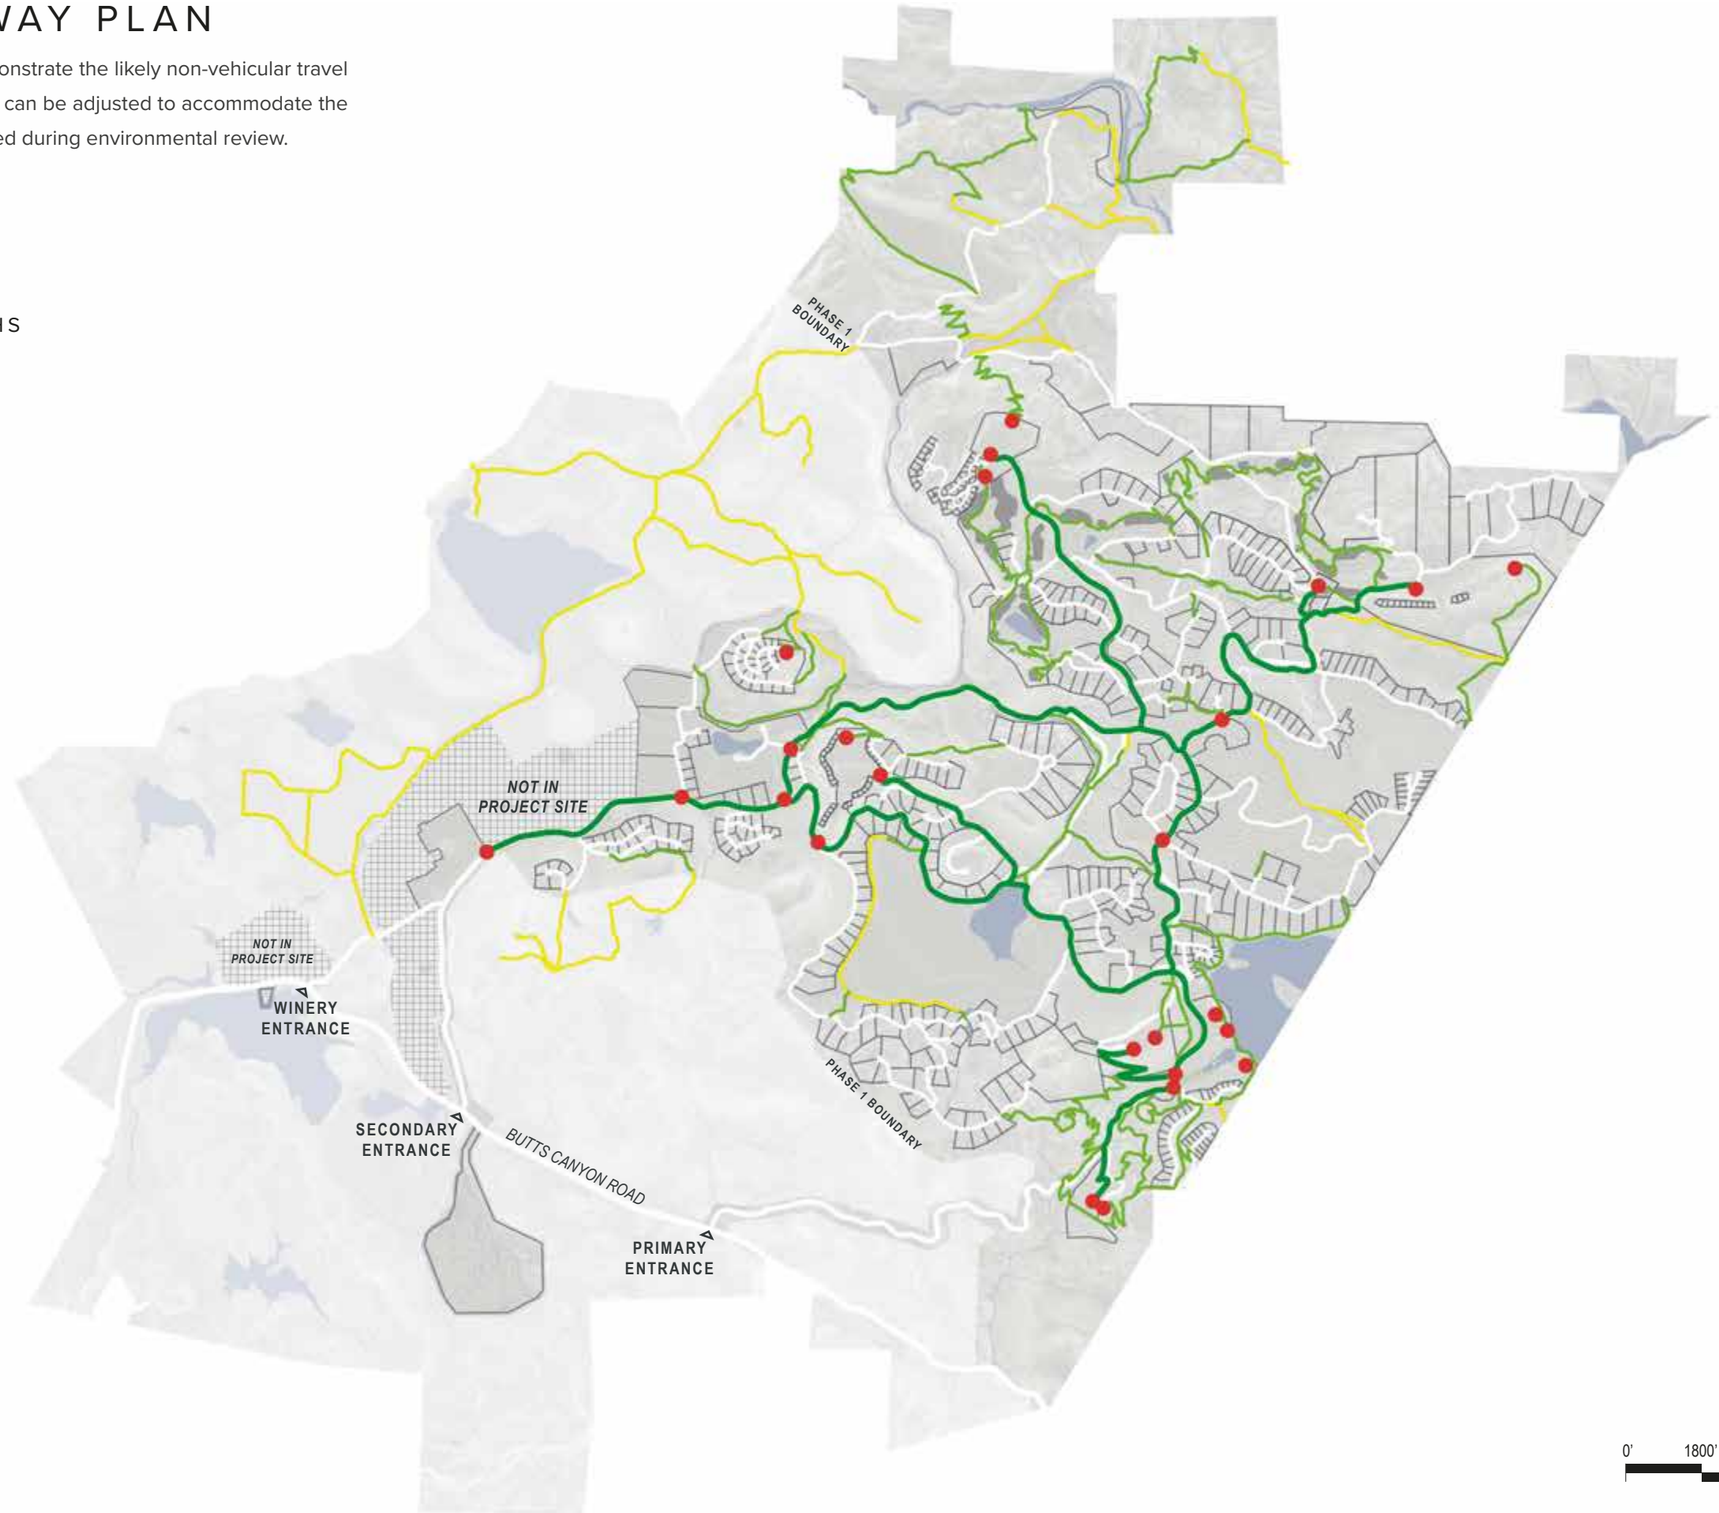


NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

CIRCULATION PATHWAY PLAN

This conceptual pathway network is intended to demonstrate the likely non-vehicular travel routes and connections throughout the site. All paths can be adjusted to accommodate the protection of sensitive and protected species identified during environmental review.

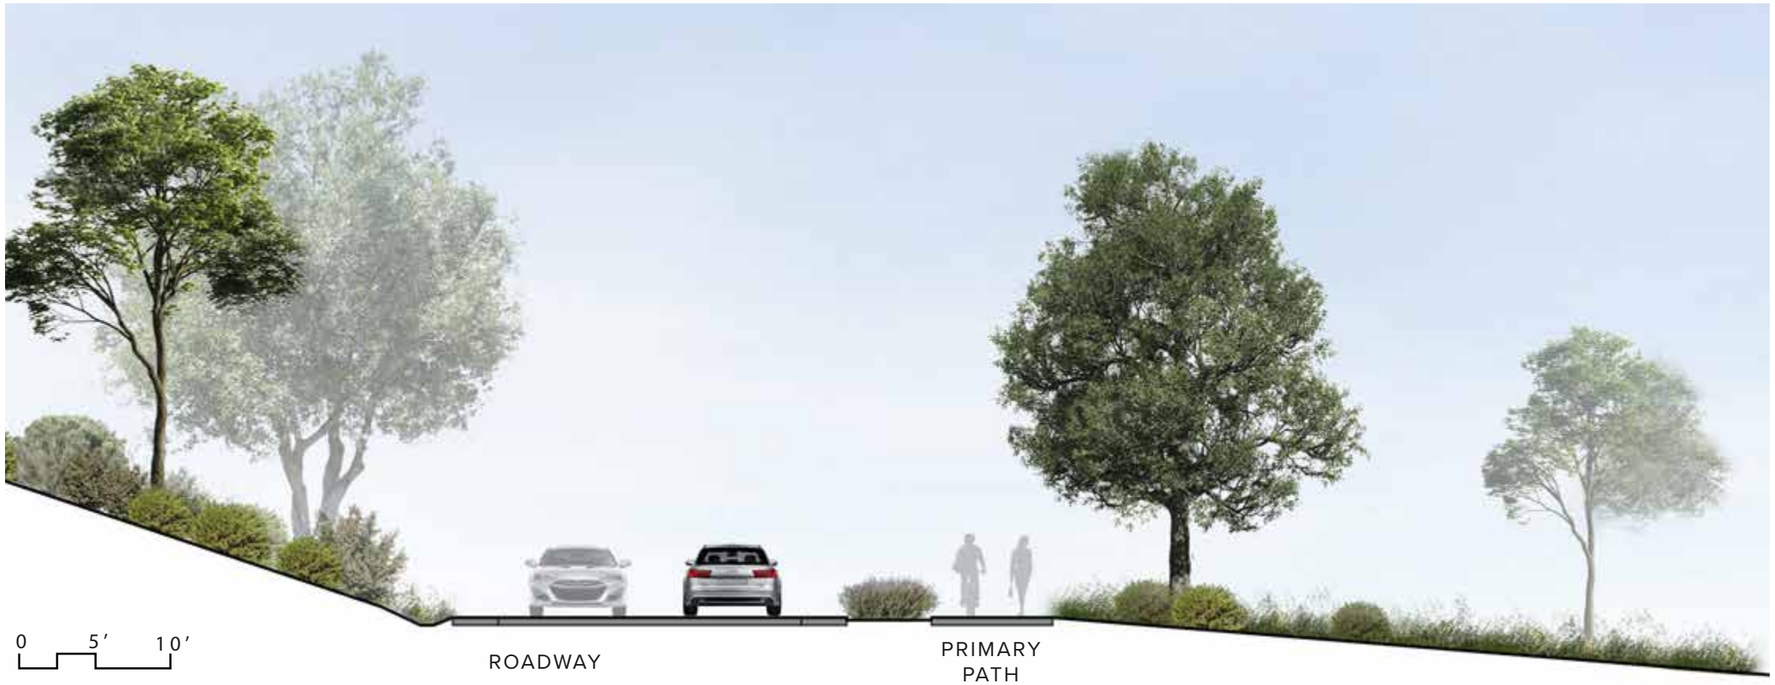
- PRIMARY NEW PATHS *(ADJACENT TO PRIMARY ROADWAYS)*
- SECONDARY NEW TRAILS
- SECONDARY EXISTING TRAILS
- CONNECTION TO RESORT PATHS



0' 1800' 3600' 7200'

NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

CIRCULATION PATHWAY TYPICAL CONDITIONS



PRIMARY PATH

SLOPE RANGE
0% - 8%

WIDTH RANGE
4' - 6'

SURFACE
Permeable Pavement

PURPOSE and CONDITIONS
Provide convenient pedestrian and bicycling routes to access resorts and amenities.

Pathway situated adjacent to primary roadway network; pathway separates vehicular and non-vehicular users on these more heavily-travelled routes.

SECONDARY TRAIL

SLOPE RANGE
0% - 15%

WIDTH RANGE
5' - 15'

SURFACE
Dirt/Gravel

PURPOSE and CONDITIONS
Re-utilize and expand upon existing ranch road network to provide recreational walking, running, hiking, biking, and horseback riding opportunities.

WATER MANAGEMENT AREAS

The project will be supplied by a combination of water sources including water supply wells for domestic purposes, reliance on existing surface water rights, reclaimed water from on-site treatment, and irrigation wells. The map shows the location of seven well fields where two or more, deep water supply wells will be installed to supply the domestic water supply to the project. The location of each well field area is based on the yield of test wells completed on the property. The plan shows the location of alternative water storage reservoirs that could include above ground and/or underground tanks or cisterns. The plans also show the conceptual layout of the water conveyance and distribution lines for both potable and non-potable water.

WASTEWATER SERVICE AREAS

Based on the large and distributed development plan for the project, a decentralized wastewater management approach has been taken to manage wastewater from each cluster area. Eight (8) wastewater service areas are proposed and each area will have a discrete sanitary sewer system and wastewater reclamation plant to treat and reuse recycled water in close proximity to the commercial areas on the site. Each service area will likely have a 100,000 gallon recycled water storage facility and effluent pumping system. The recycled water will be reused for non-potable water demands. In addition individual lots have the option to be served by either standard or enhanced on-site wastewater septic systems.

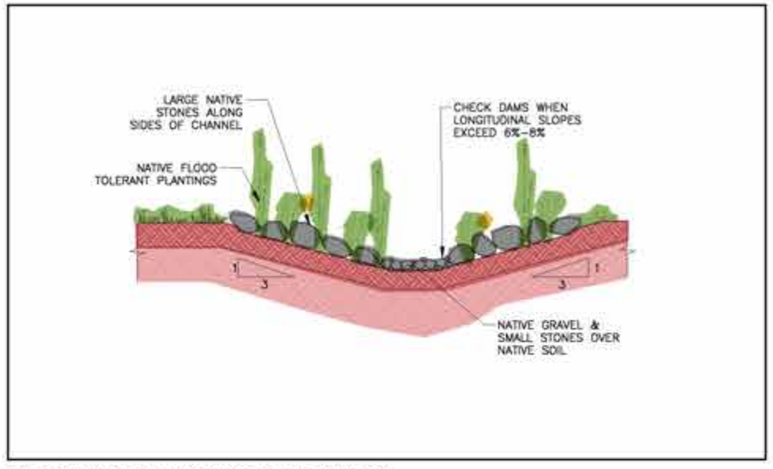
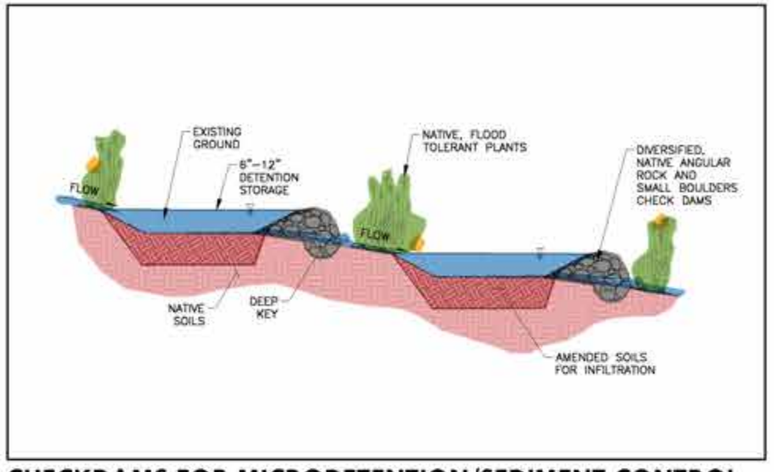
CONTOUR SWALE/CUTOFF SWALE

Contour swales and cutoff swales are integrated into the landscape to collect and transport hillside runoff prior to a roadside swale. The contour swales will also be used to disperse roof runoff and convey water towards raingardens, ponds and natural drainages. These on-contour features provide additional surface water storage and slow runoff to mimic the natural hydrologic response of the site.



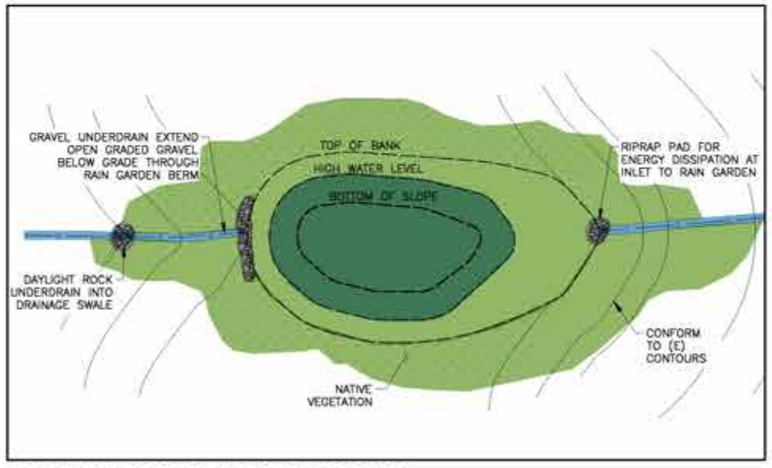
VEGETATED ROADSIDE SWALE

The project will use roadside swales in lieu of conventional piped conveyance systems. These swales will maintain existing surface drainage patters to the maximum extent feasible and will be used in conjunction with check dams and raingardens to provide passive stormwater conveyance and treatment with minimal site disturbance and reduced erosion.



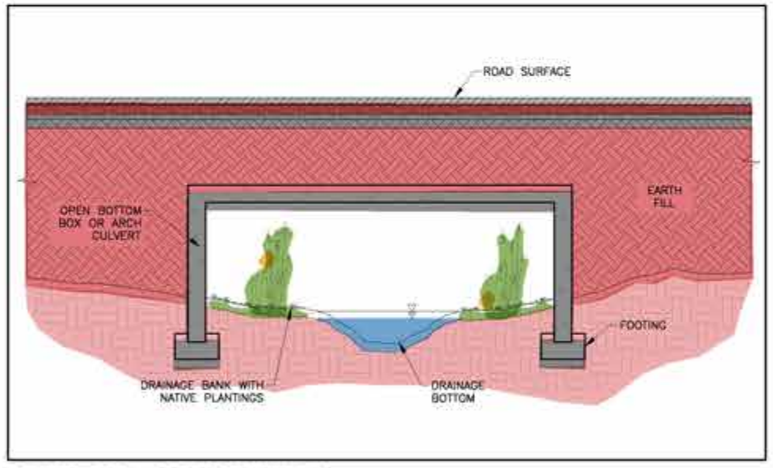
CHECKDAMS FOR MICRODETENTION/SEDIMENT CONTROL

Checkdams will be used in conjunction with vegetated roadside swales to provide erosion protection and stormwater treatment. They can be used in high slope (>4%) areas to control erosion and can be used in shallower slope regions to provide storage, treatment and infiltration. Through a series of micro detention pockets, stormwater will be slowed down and captured prior to migrating through the stone checkdams.



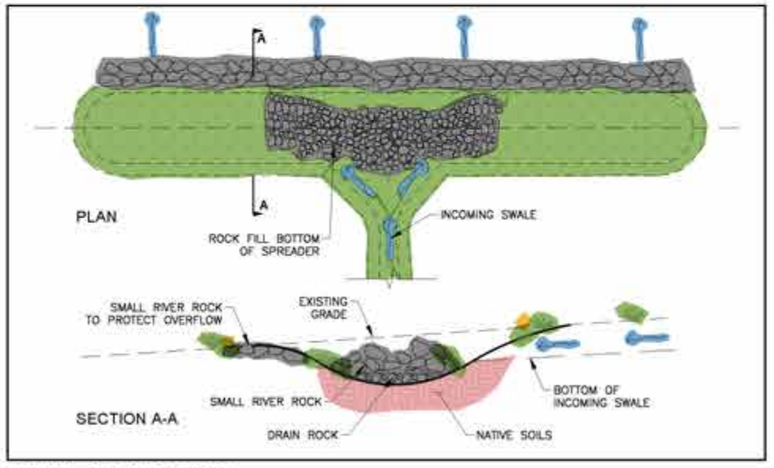
RAINGARDEN FOR TREATMENT

Raingardens will be used to provide treatment of stormwater running off roadways and hardscape areas prior to entering drainages. Generally, raingardens will be used in-line with vegetated roadside swales prior to entering a drainage. Raingardens will also be used within commercial areas to provide treatment for parking, hardscape, and roof areas. These treatment areas will be incorporated into the landscape and located to overflow into natural drainages.



OPEN BOTTOM CULVERTS

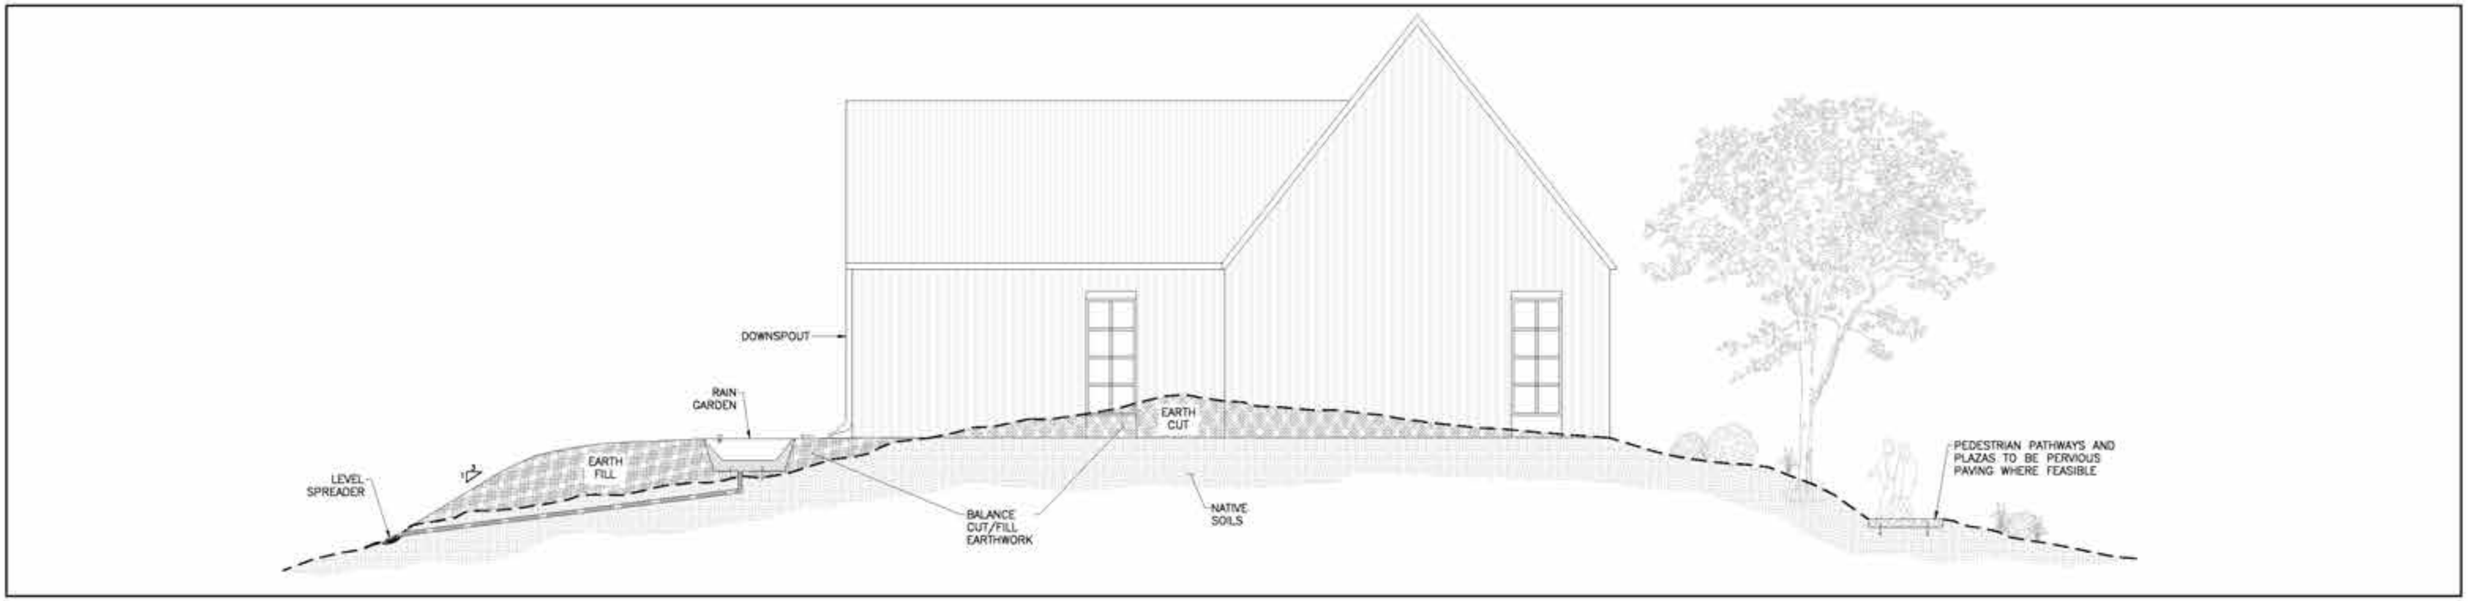
Throughout the site, there are existing drainages which have roadways crossing them. In order to provide a natural drainage channel, the project is using open bottom culverts to allow for a combination of stormwater conveyance and limited disturbance. These culverts will be both arch culverts, box culverts, and bridges.



LEVEL SPREADERS

Level spreaders will be used at the ends of drainages to allow for dispersion of stormwater from a channel into an undisturbed area of the site. This will help to prevent erosion channels from forming and provide for stormwater to drain and infiltrate through trees and undergrowth throughout the site, providing stormwater collection and treatment.

STORMWATER METHODS FOR ON-SITE DETENTION

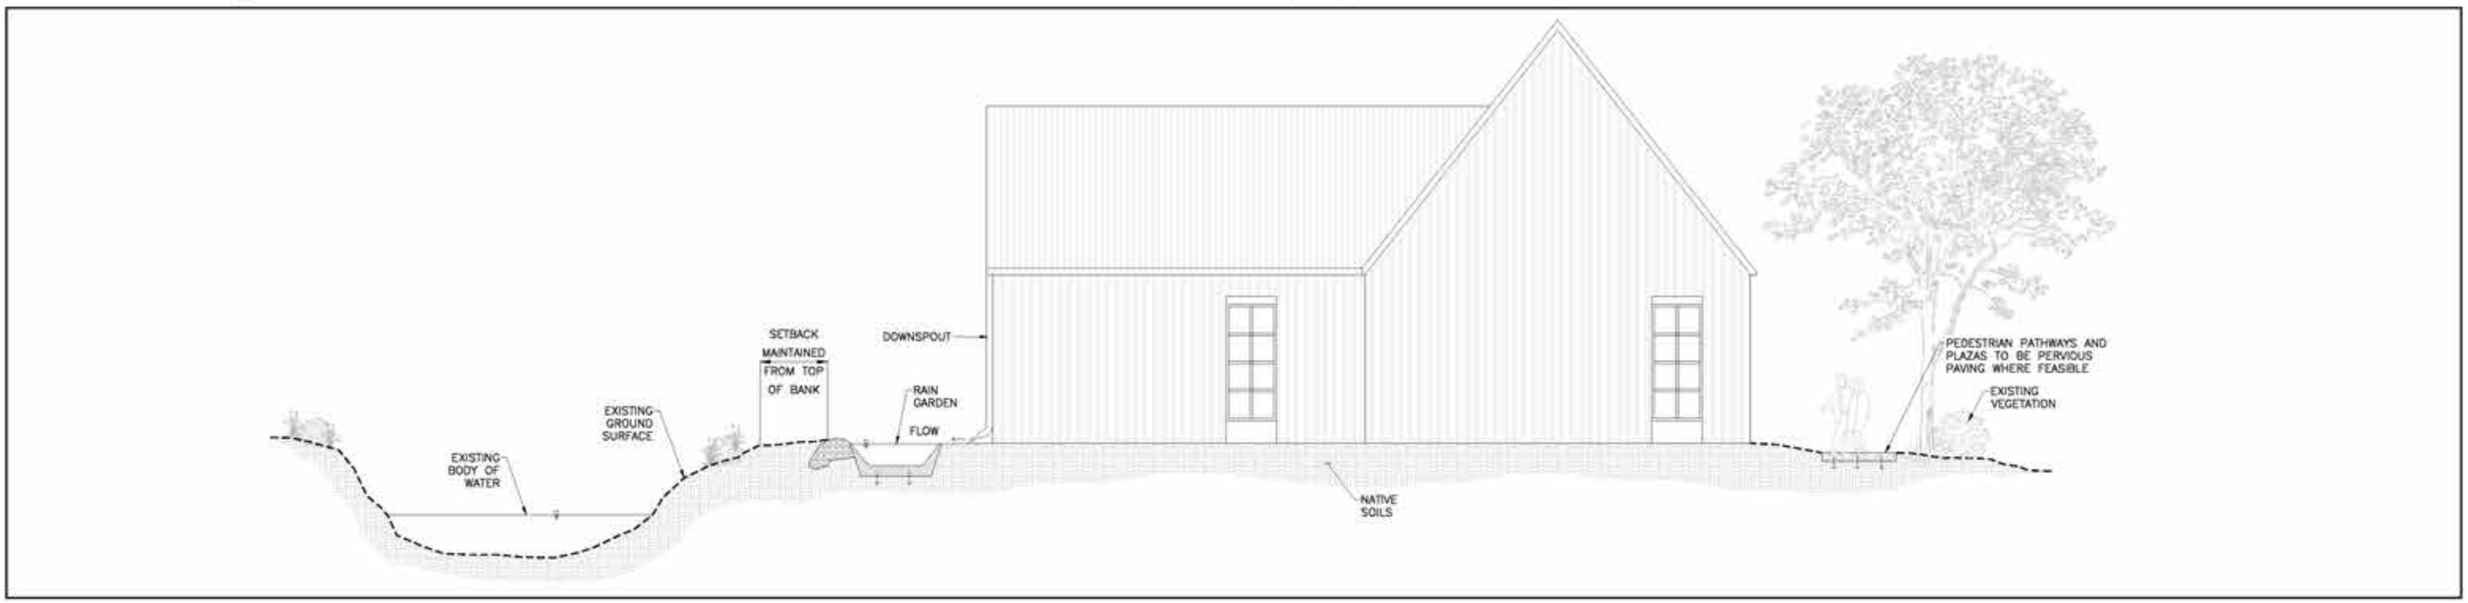


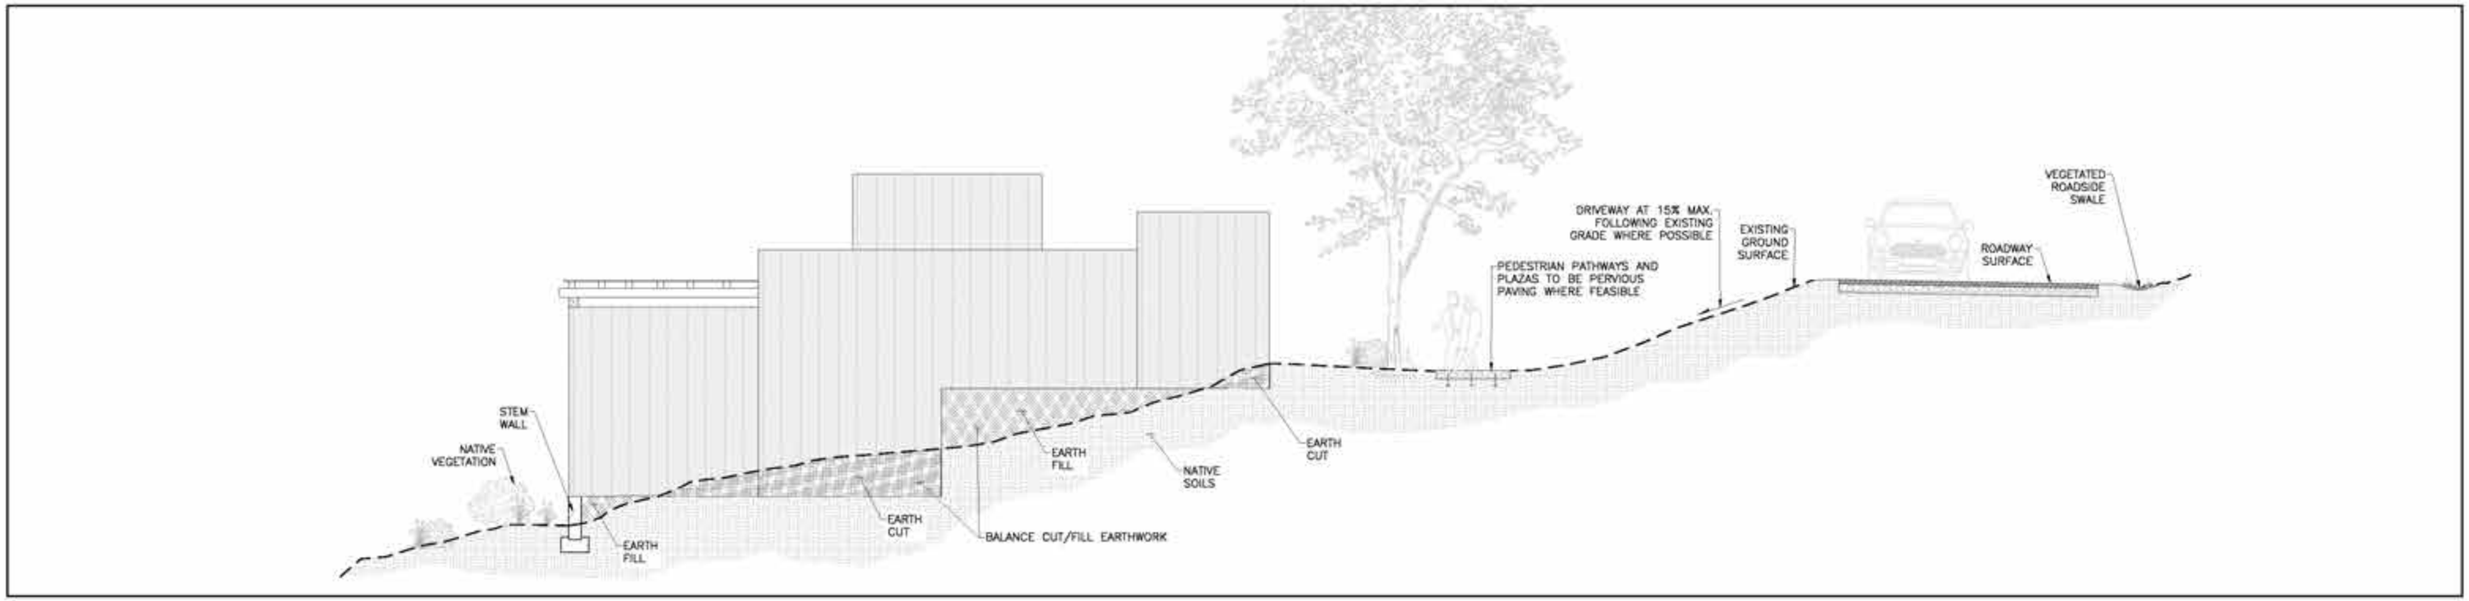
HILLTOP DEVELOPMENTS [ABOVE]

Many of the commercial areas are located at the high points of the site. Grading for these areas will attempt to balance the cut and fill within the disturbed area, while minimizing the overall extents of grading as much as is practical. Hardscape areas beyond the building will attempt to use pervious paving to reduce the amount of increased runoff coming off the hill zones.

WATER SIDE DEVEOPMENTS [BELOW]

Development adjacent to water bodies will include measures to minimize impacts to the existing hydrology, habitat, and receiving waters. These will include constructed storm water conveyances that mimic the natural drainage patterns, maintenance of setbacks from riparian zones, and material selections that preserve and improve runoff quality.



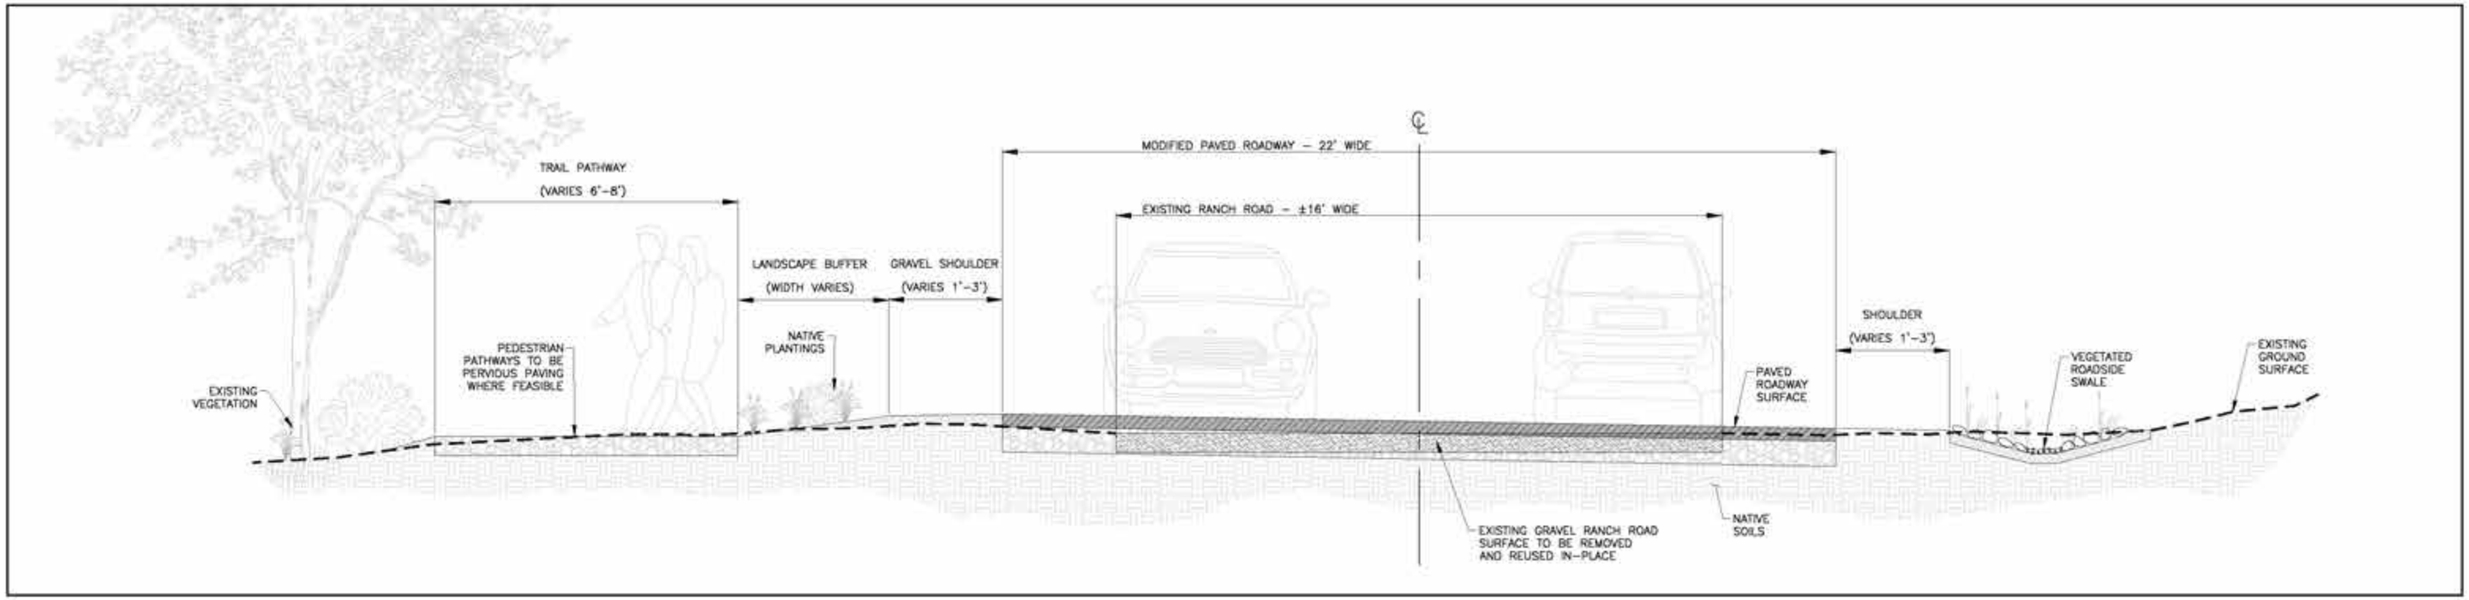


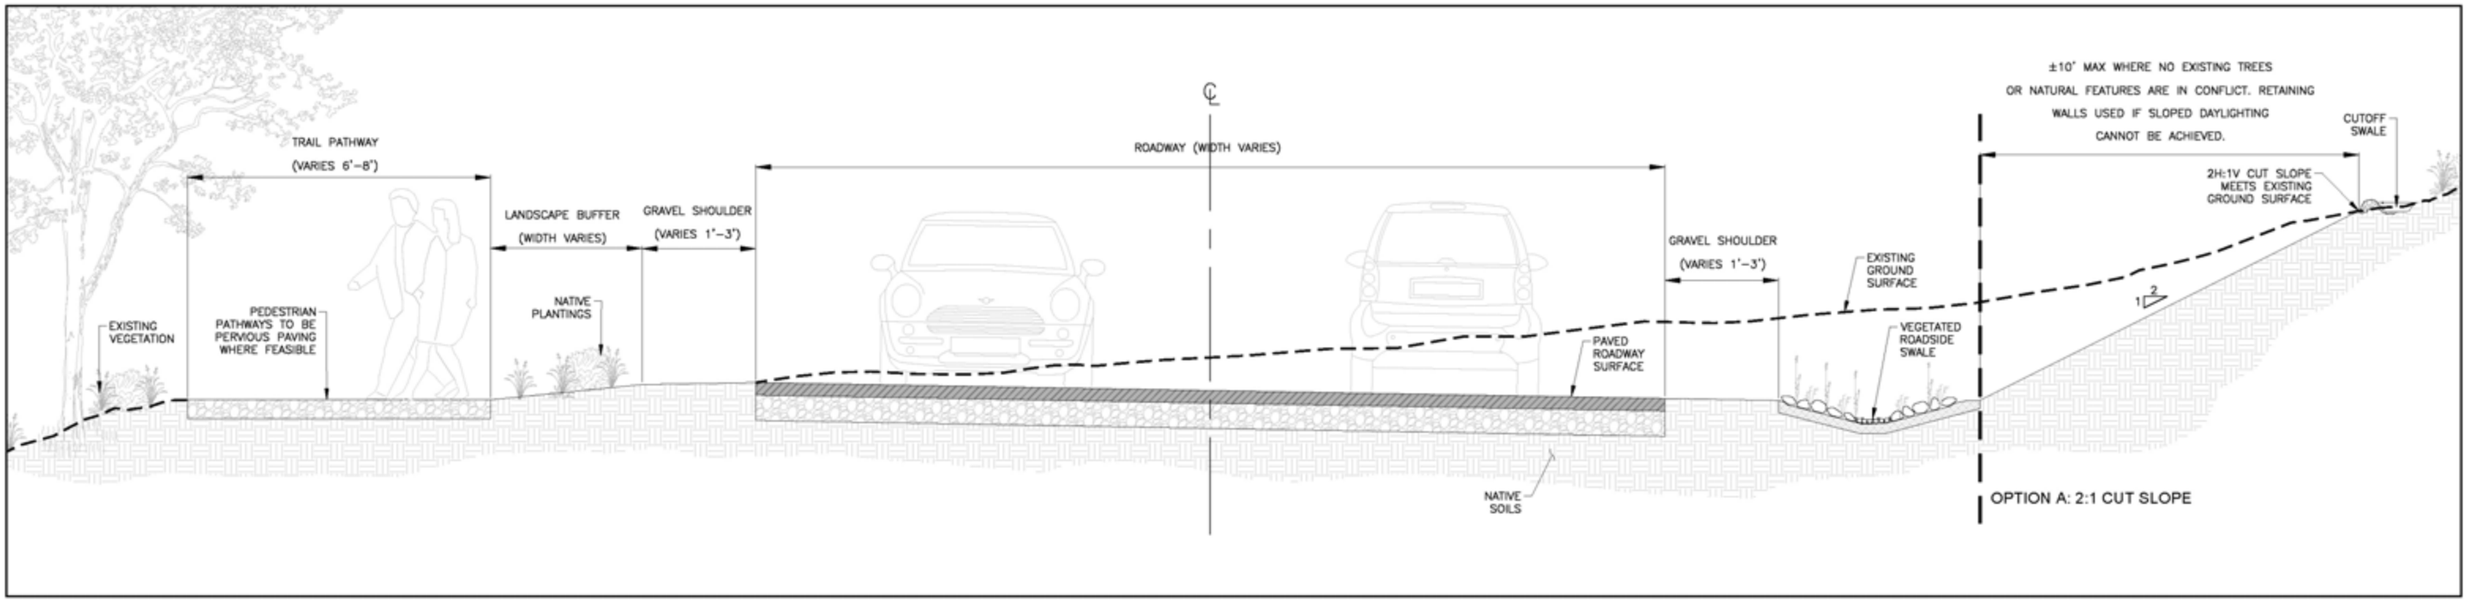
VILLA LOTS [ABOVE]

Villa lots employ a range of strategies to minimize impact to the existing site. Buildings will be located to achieve balanced earthwork cut and fill and maintain existing drainage patterns. Runoff collected from new impervious surfaces will be routed through landscape based conveyances that mitigate for water quality and peak runoff rate. Fuel maintenance and fire access will be prioritized on each developed site.

ROADWAYS OVER EXISTING RANCH ROADS [BELOW]

The majority of proposed roads will follow the alignments of existing ranch roads that are well established and maintained in good repair. Road corridors will be widened and improved to meet access requirements for emergency vehicles, guests, and operations. Runoff collected from new roads will be managed locally through a range of landscape based strategies. Earthwork cut and fill will be balanced locally as is feasible.



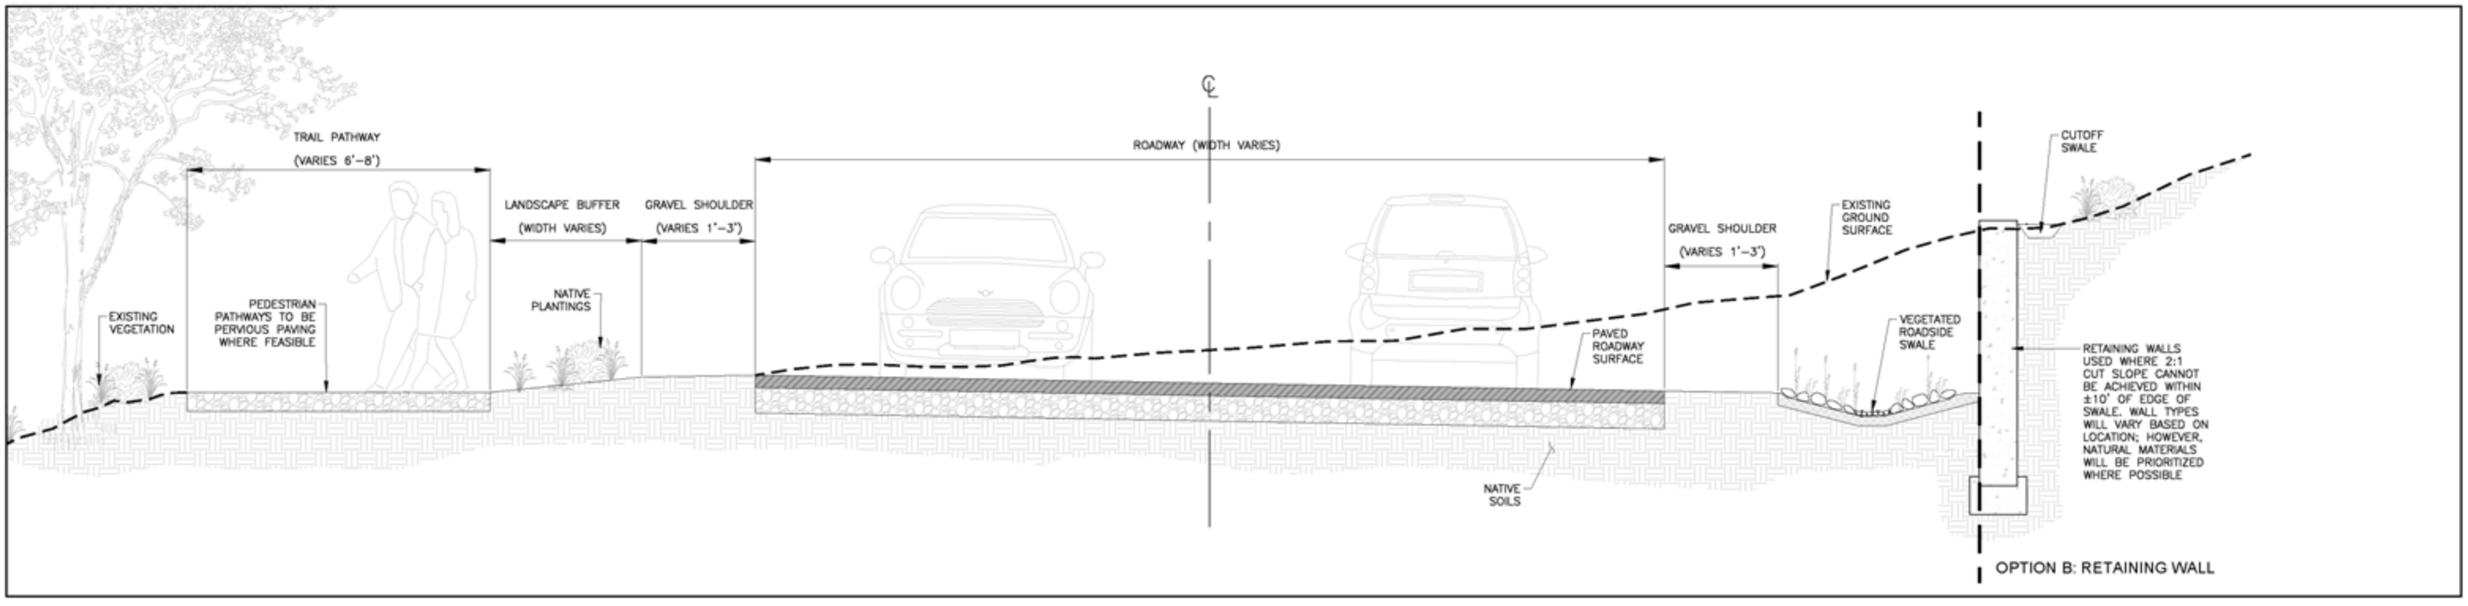


ROADWAYS THROUGH UNDEVELOPED LAND WITHOUT RETAINING WALL [ABOVE]

Roadways through undeveloped land will be carefully aligned to meet geometric and slope requirements while minimizing the impact to the existing topography, habitat, and hydrology. Where cross slopes are gentle, cut and fill slopes will be used to conform to existing grades. Cutoff swales will route run-on around new roads to preserve runoff quality and runoff collected from new impervious surfaces will be routed through site based elements that mitigate for water quality and peak runoff rates.

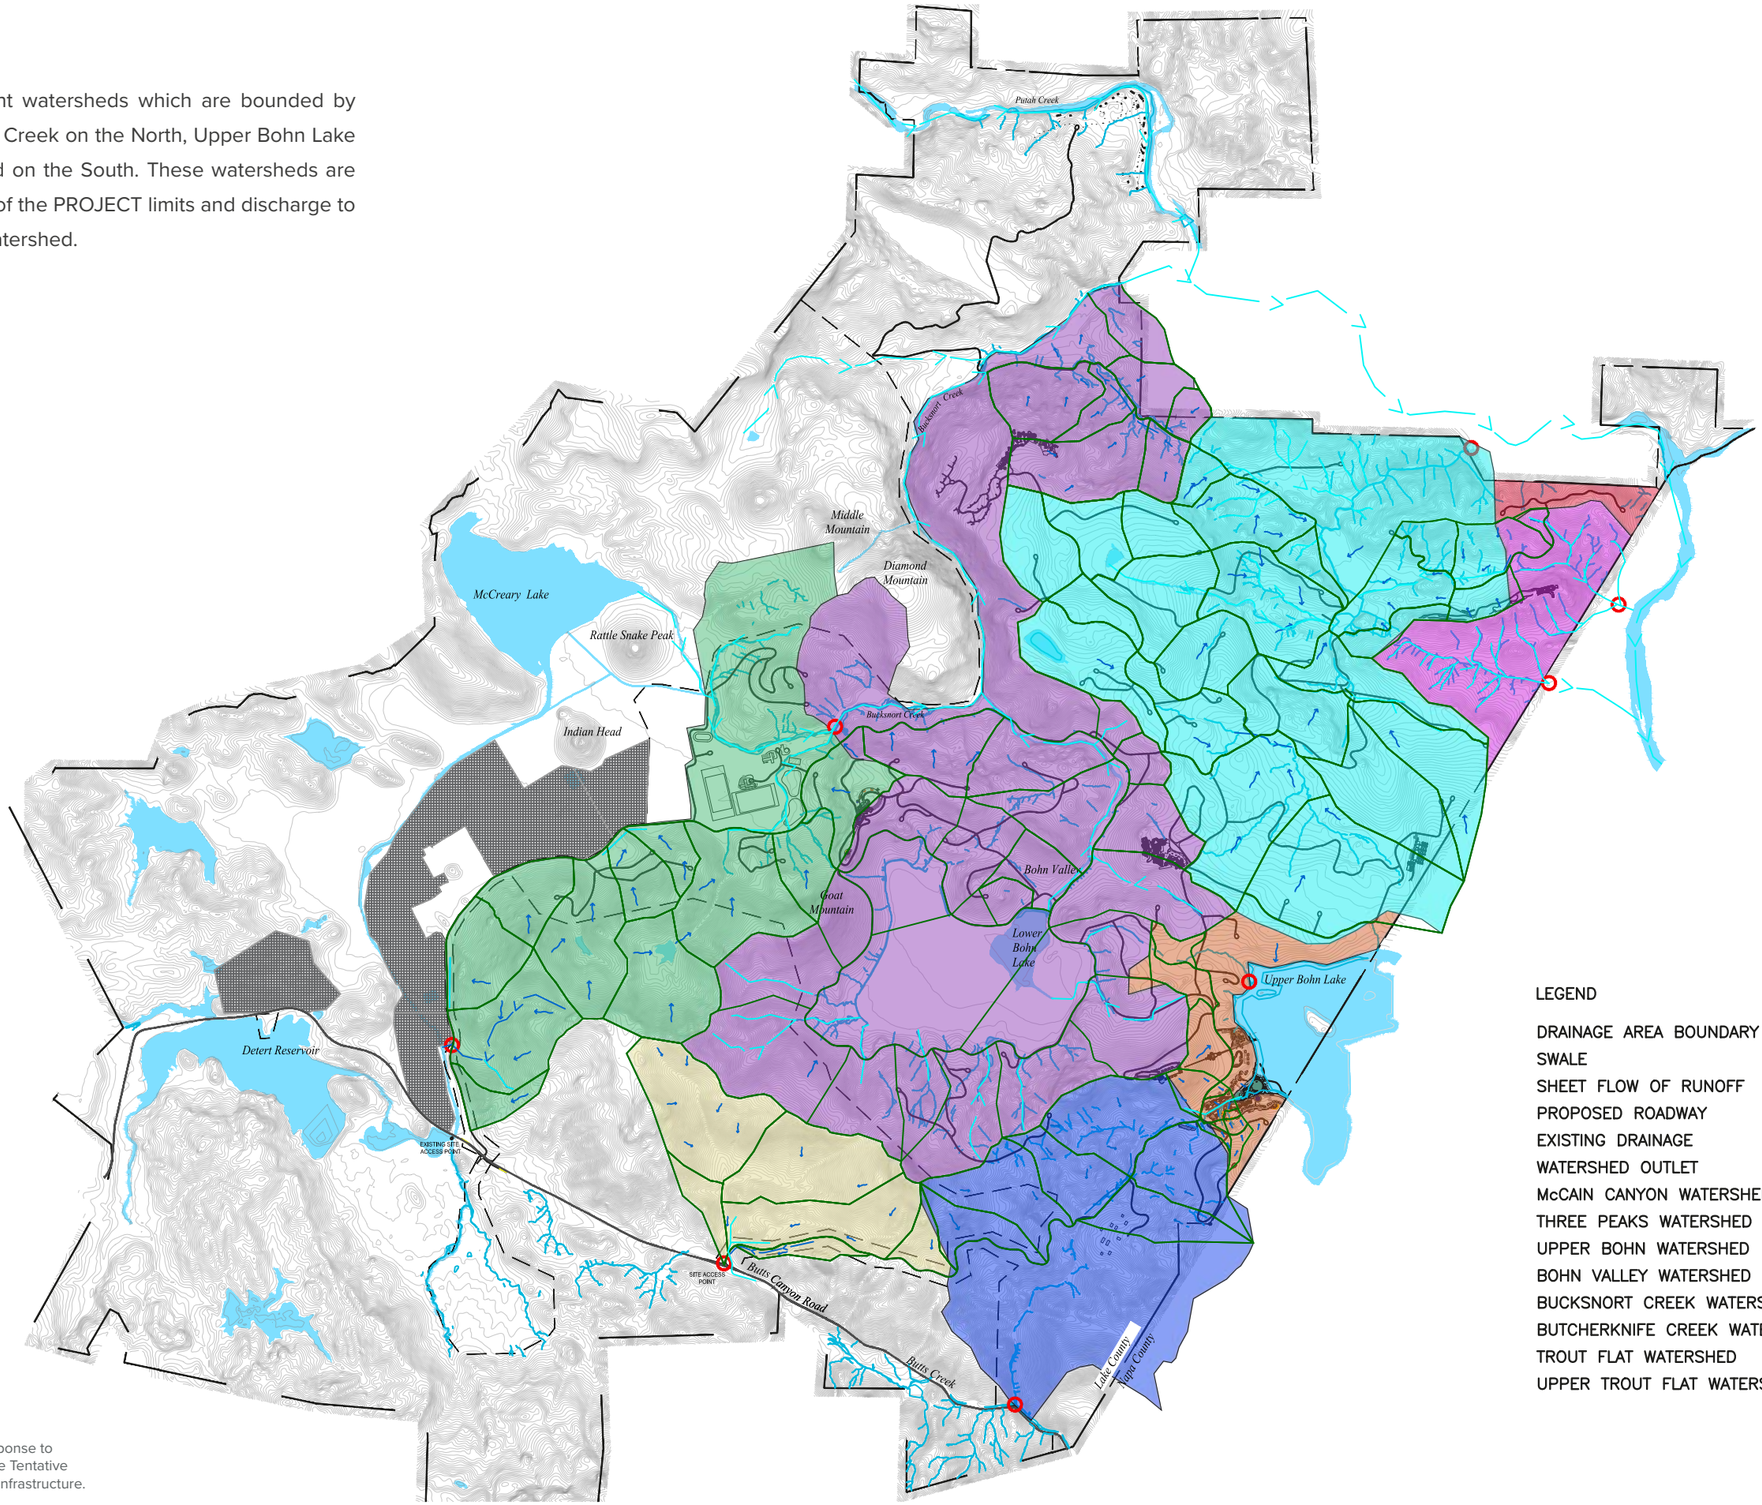
ROADWAYS THROUGH UNDEVELOPED LAND WITH RETAINING WALL [BELOW]

In areas where necessitated by cross slopes, new roadways will include retaining walls to limit the extents of disturbance. Cutoff swales will route run-on around new roads to preserve runoff quality and runoff collected from new impervious surfaces will be routed through site based elements that might mitigate for water quality and peak runoff rates.



WATERSHEDS

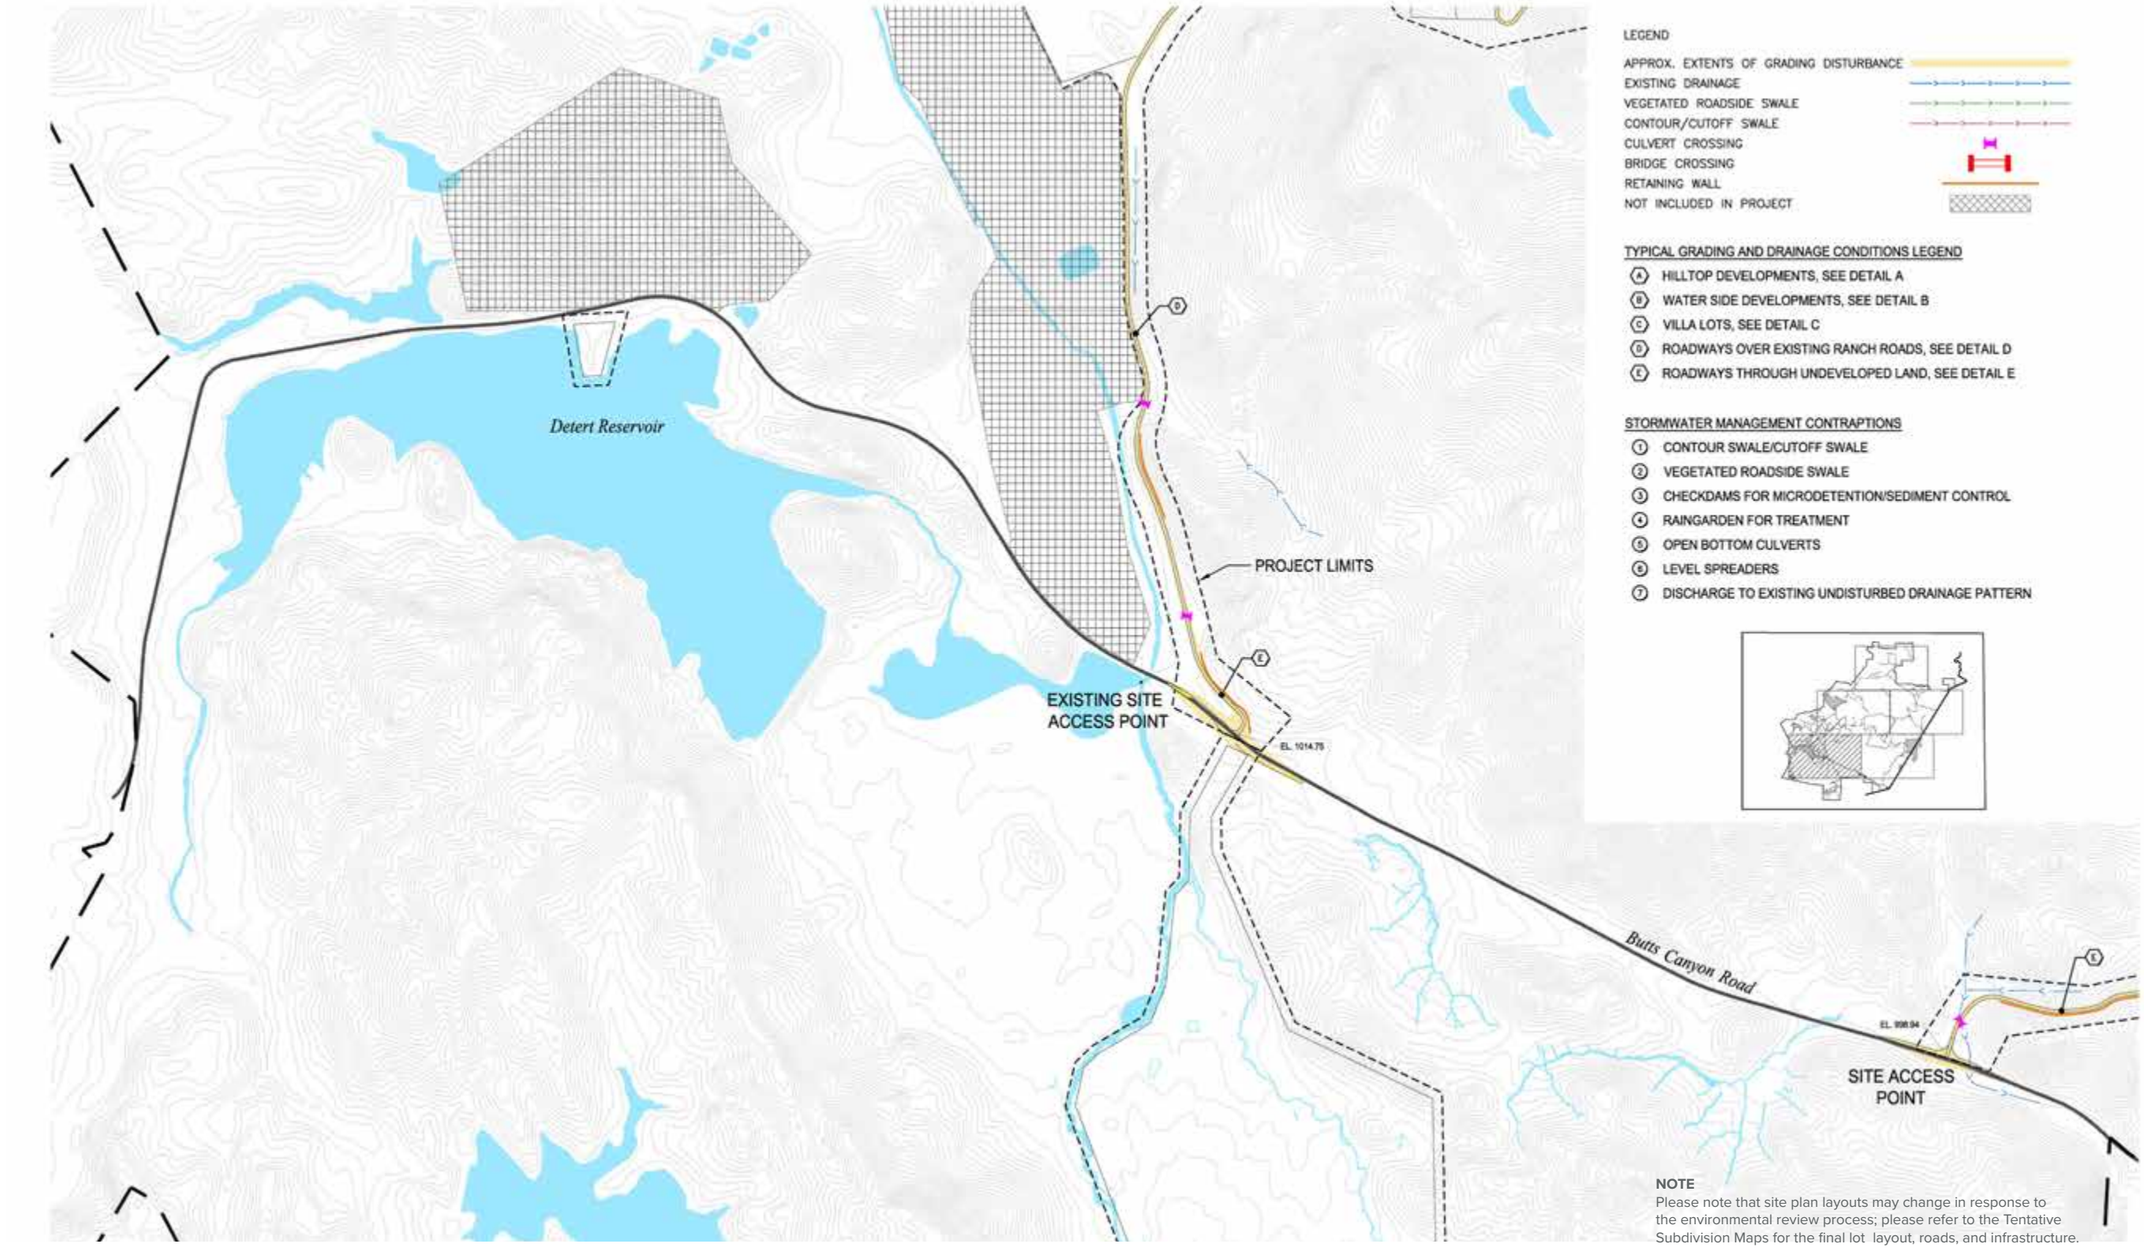
The Maha site is composed of eight watersheds which are bounded by Bucksnort Creek on the West, Putah Creek on the North, Upper Bohn Lake on the East, and Butts Canyon Road on the South. These watersheds are mainly contained within the bounds of the PROJECT limits and discharge to drainages and creeks within each watershed.



NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

GRADING & DRAINAGE PLAN

Grading design for roads, structures, and site landscaping will be carefully laid out to work with existing contours, minimizing the disturbance to existing conditions and habitat as much as possible. Cut and fill conditions will be balanced across the site in as close proximity as possible in order to reduce truck traffic and overall disturbance. Drainage improvements will include new crossings and conveyances that accommodate the development while preserving and enhancing the site watersheds.



NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

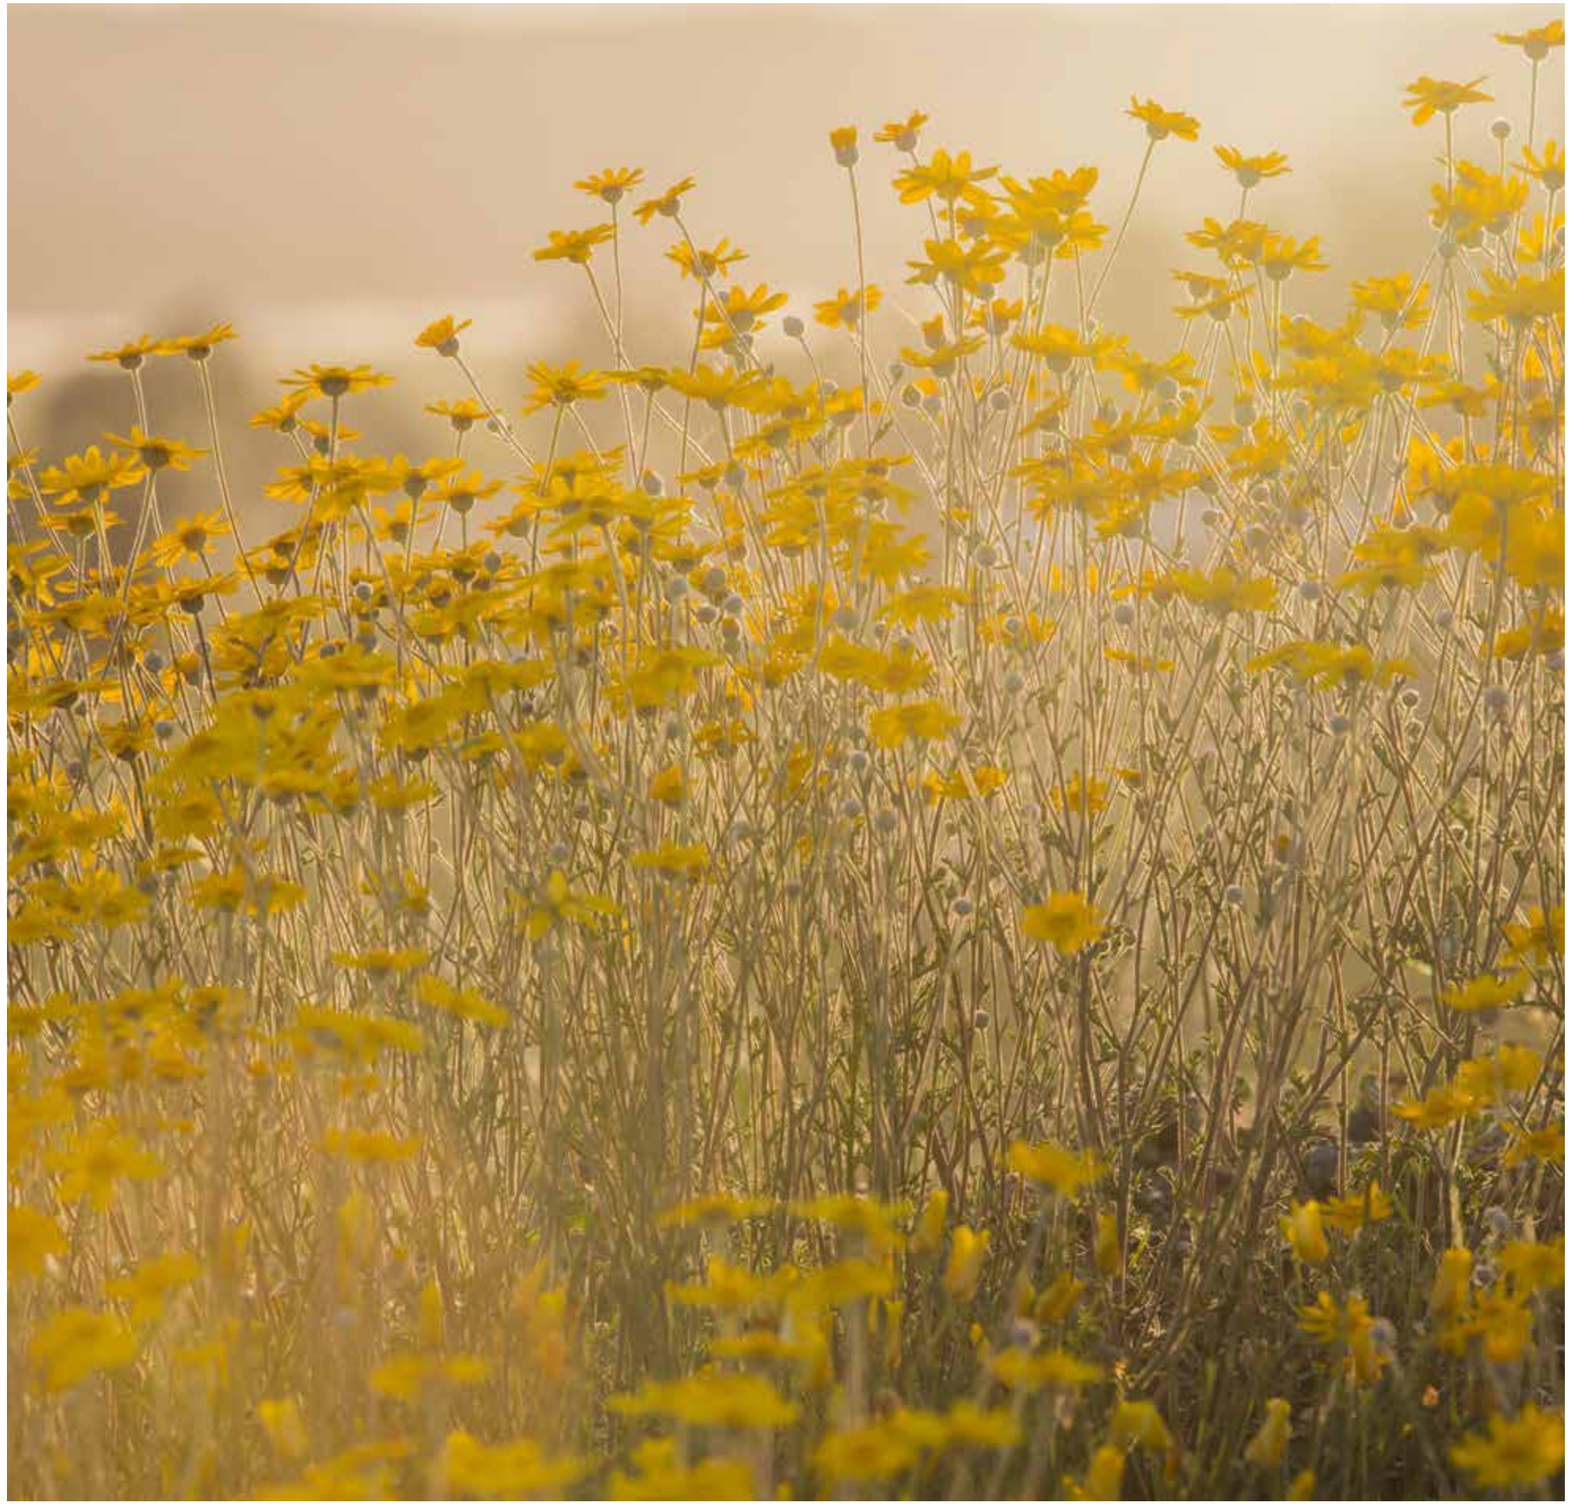
DRY UTILITIES

The availability and delivery of public services is an essential factor to consider in any new development. However, considering the scope, location, and long-term development period, it is proposed that the majority of the infrastructure will be privately owned and managed.

As narrated by the Middletown Area Plan Special Study Area No.3, innovative development and Smart Growth techniques are the ideal fit for development within Guenoc Valley. By “low impact development” and incorporating strategies that mimic and augment natural systems, the project will enhance the landscape’s resilience and adaptability throughout all phases of development.

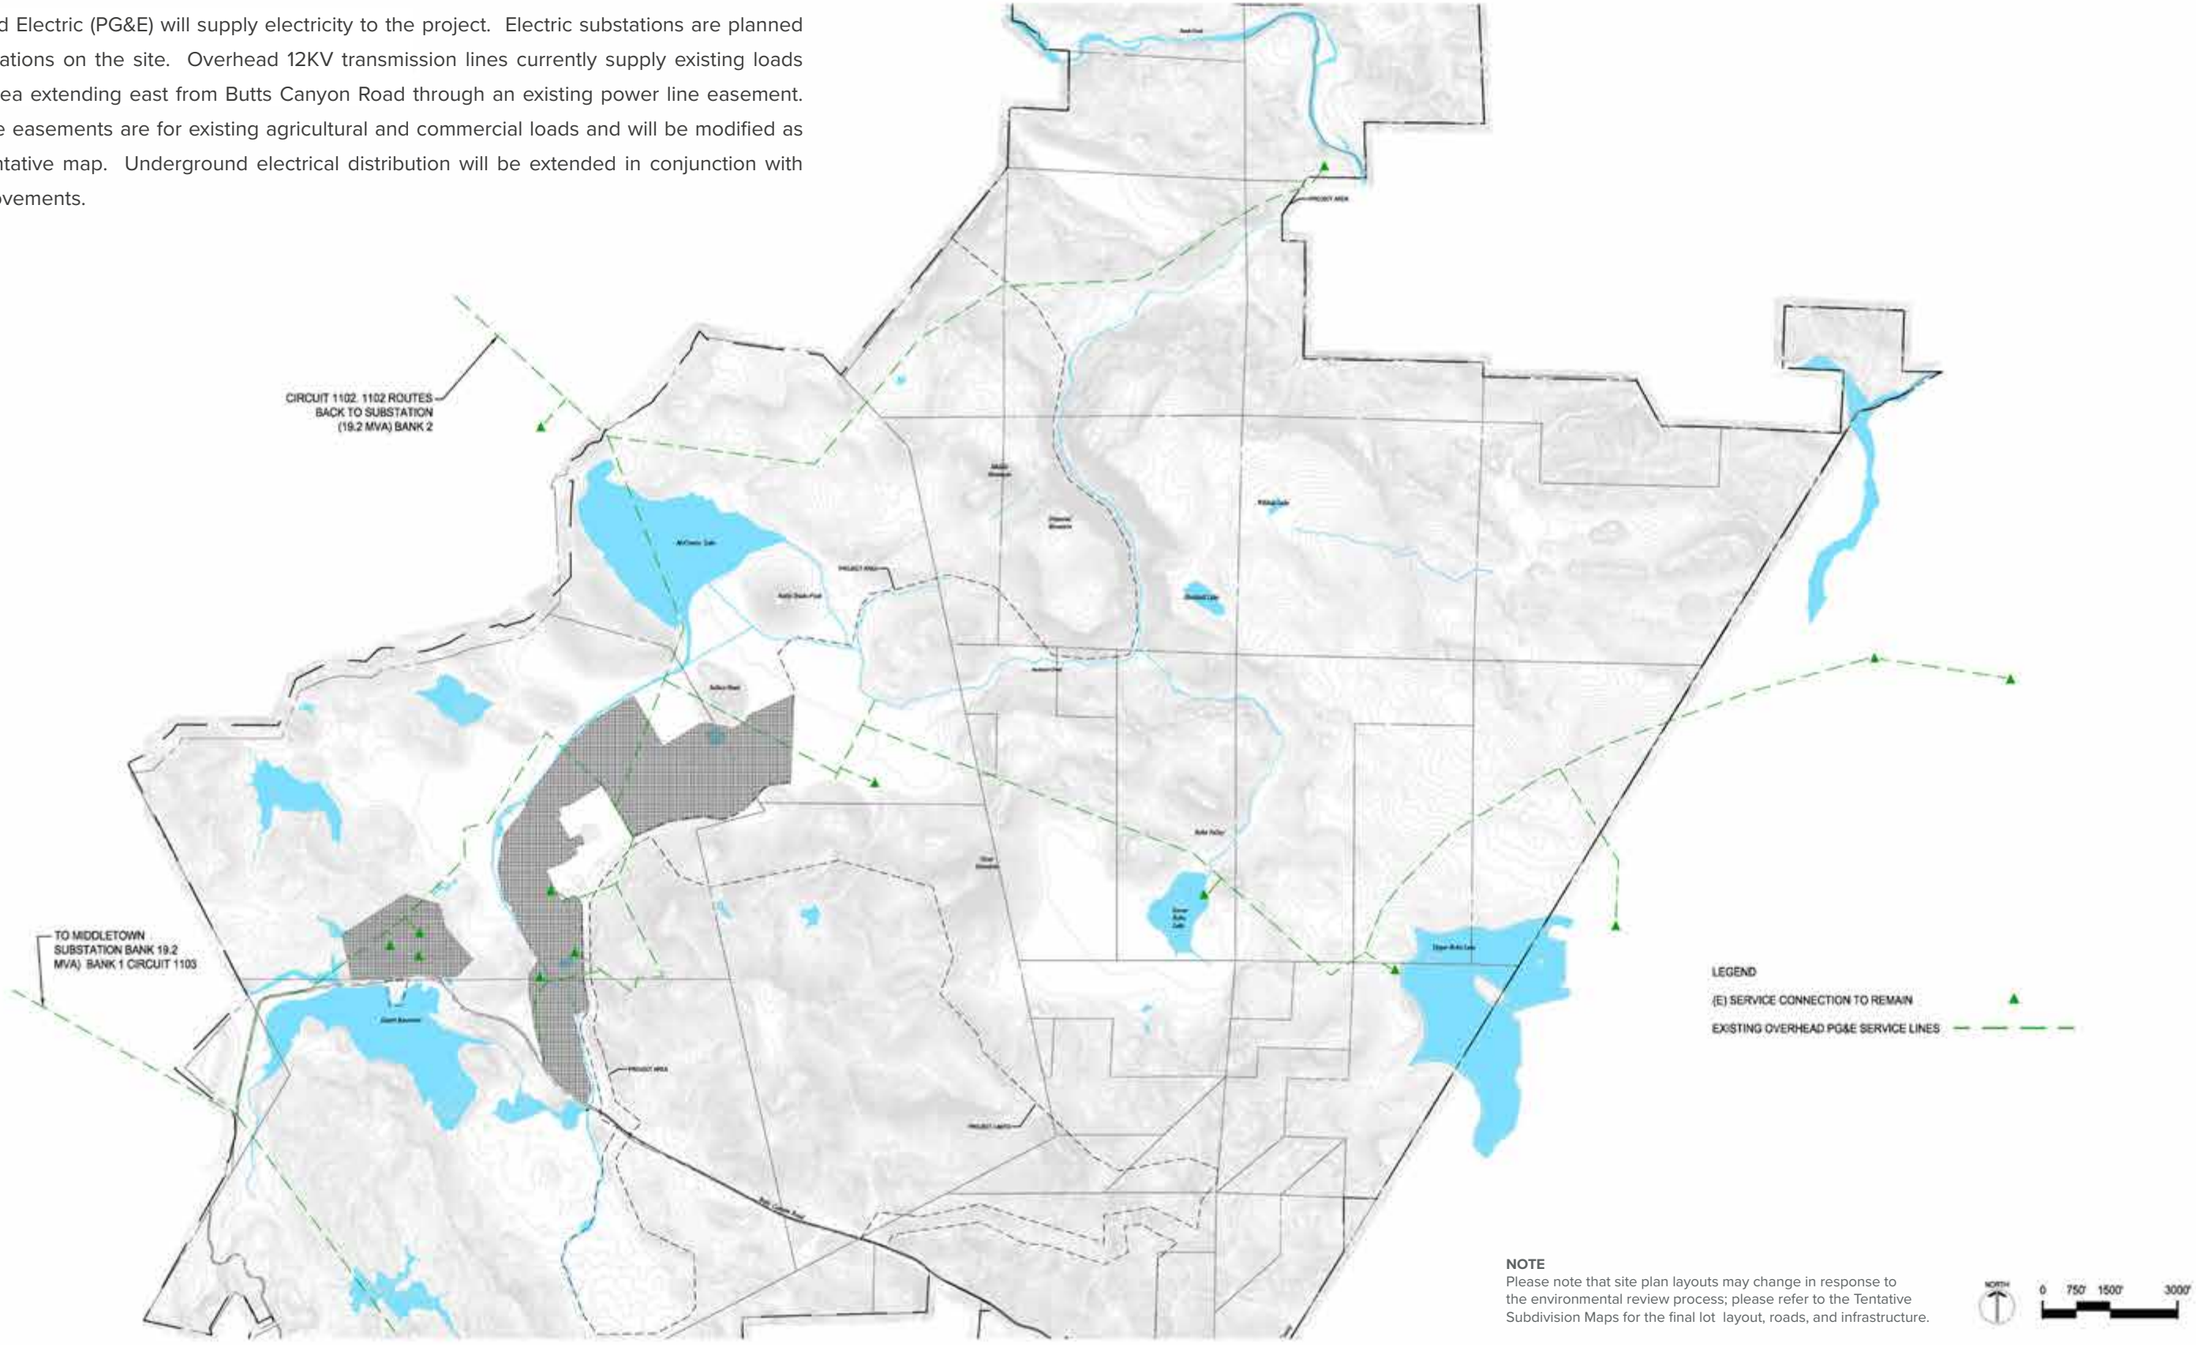
The GVD Specific Plan includes utility infrastructure required to serve the architectural clusters. Each component of the utility infrastructure system is designed to accommodate the build-out of the GVD area. Phasing of infrastructure improvements and funding obligations will be detailed in the Development Agreements. Utility infrastructure will be constructed, dedicated with public easements, as seen on the tentative subdivision map.

On and potential off-site, renewable energy generation and storage systems will be included in the development. The on-site renewables will be built in a mix of the architecture, centralized at one location on the site, and/or be clustered within developments.



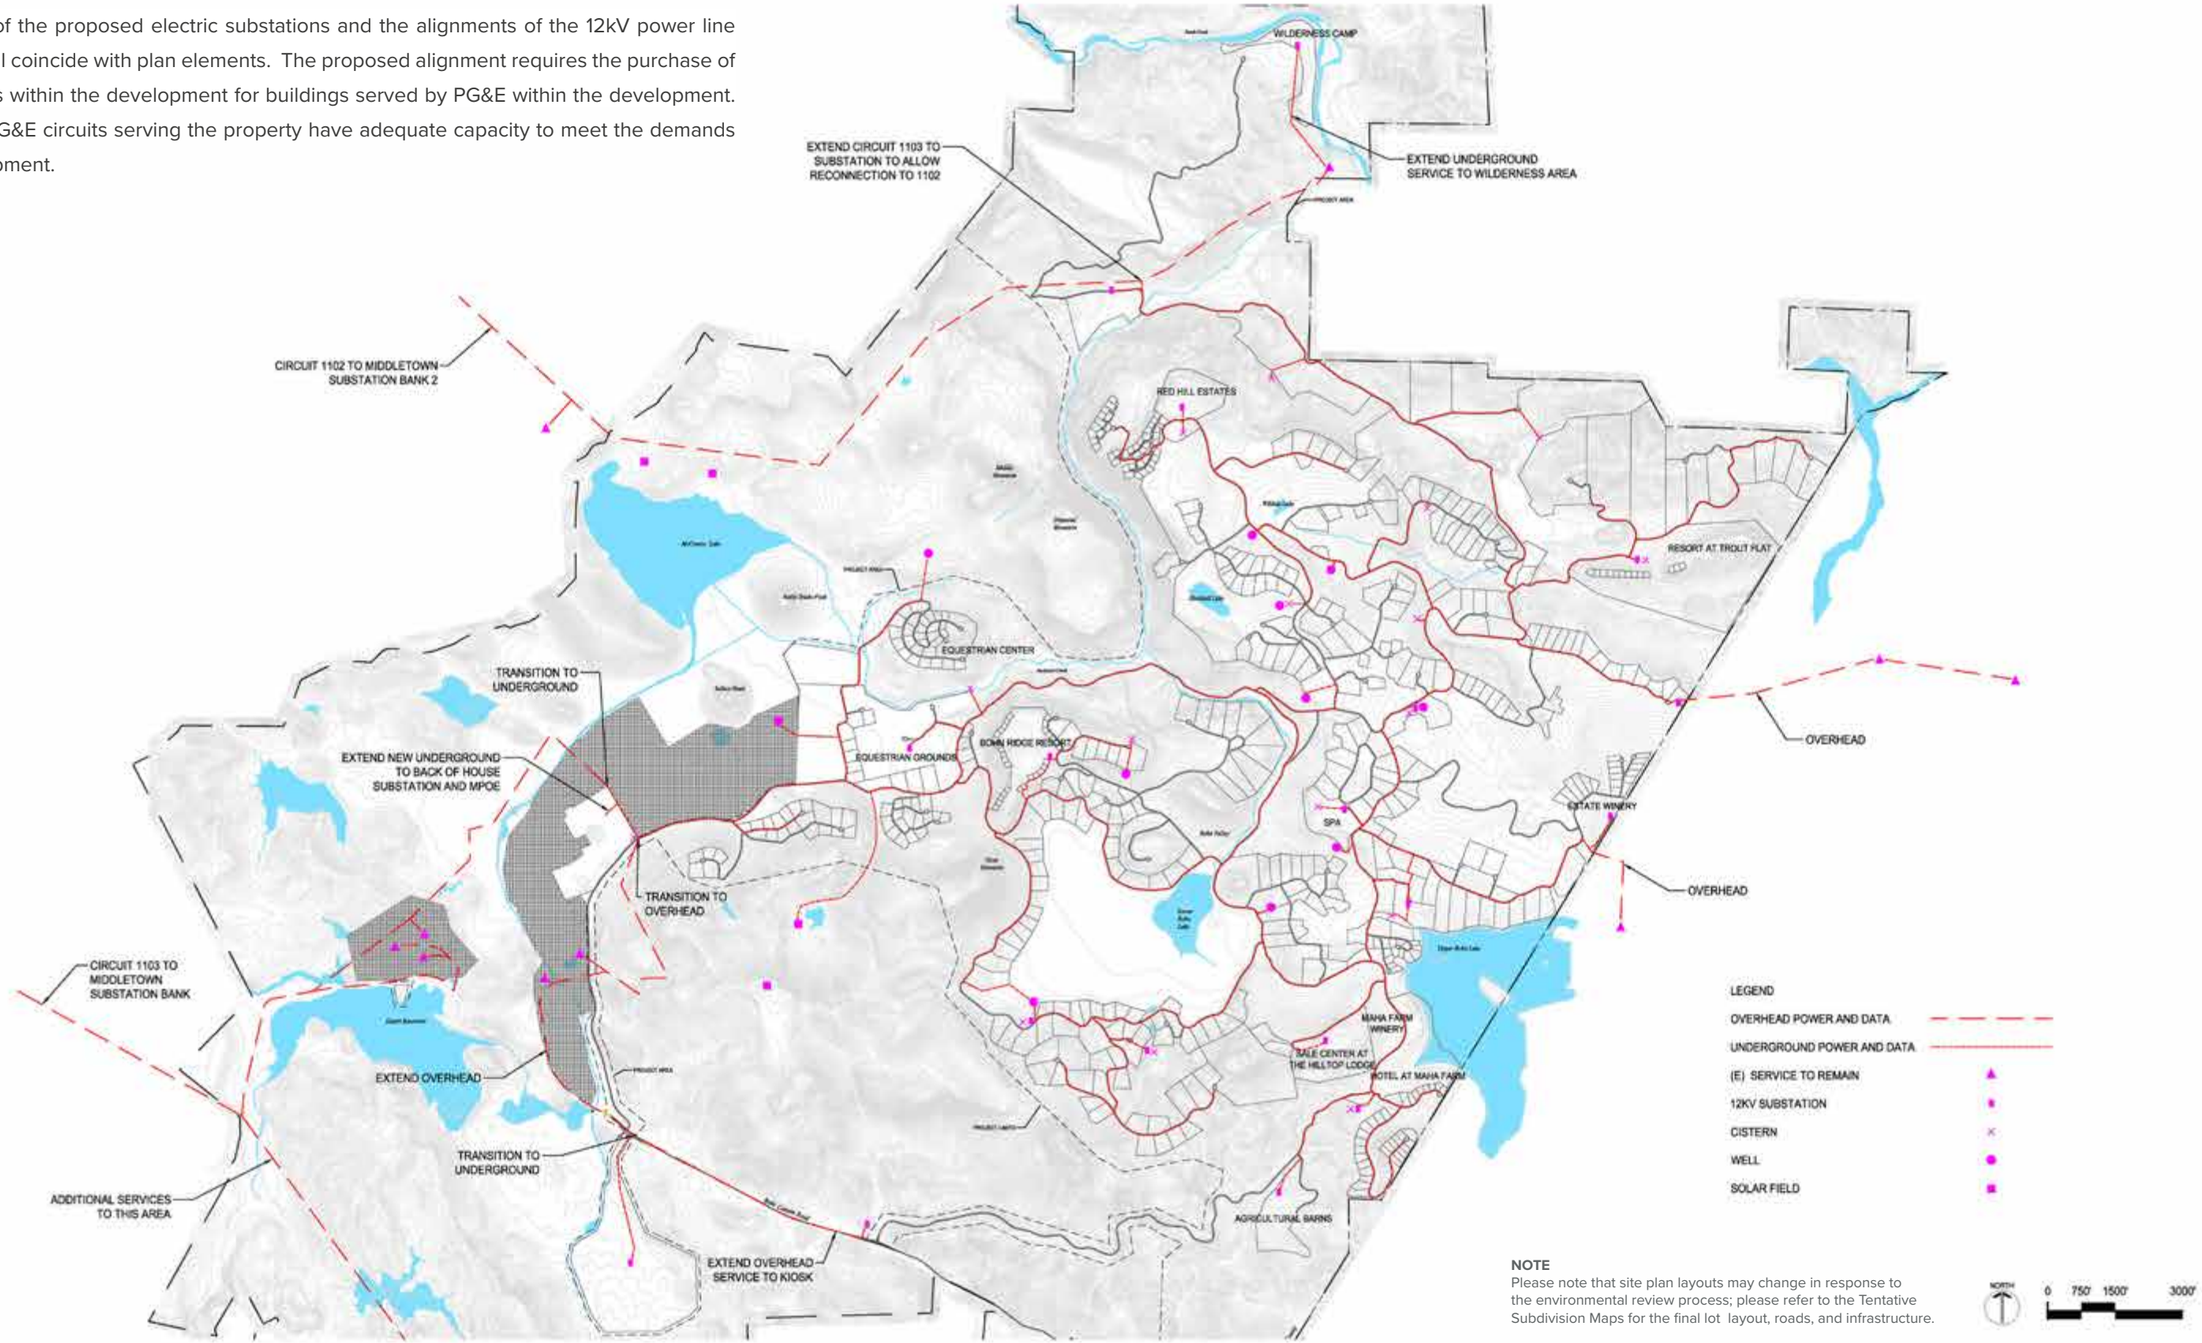
DRY UTILITIES EXISTING PG&E SERVICES

Pacific Gas and Electric (PG&E) will supply electricity to the project. Electric substations are planned at multiple locations on the site. Overhead 12KV transmission lines currently supply existing loads through the area extending east from Butts Canyon Road through an existing power line easement. The power line easements are for existing agricultural and commercial loads and will be modified as part of the tentative map. Underground electrical distribution will be extended in conjunction with roadway improvements.

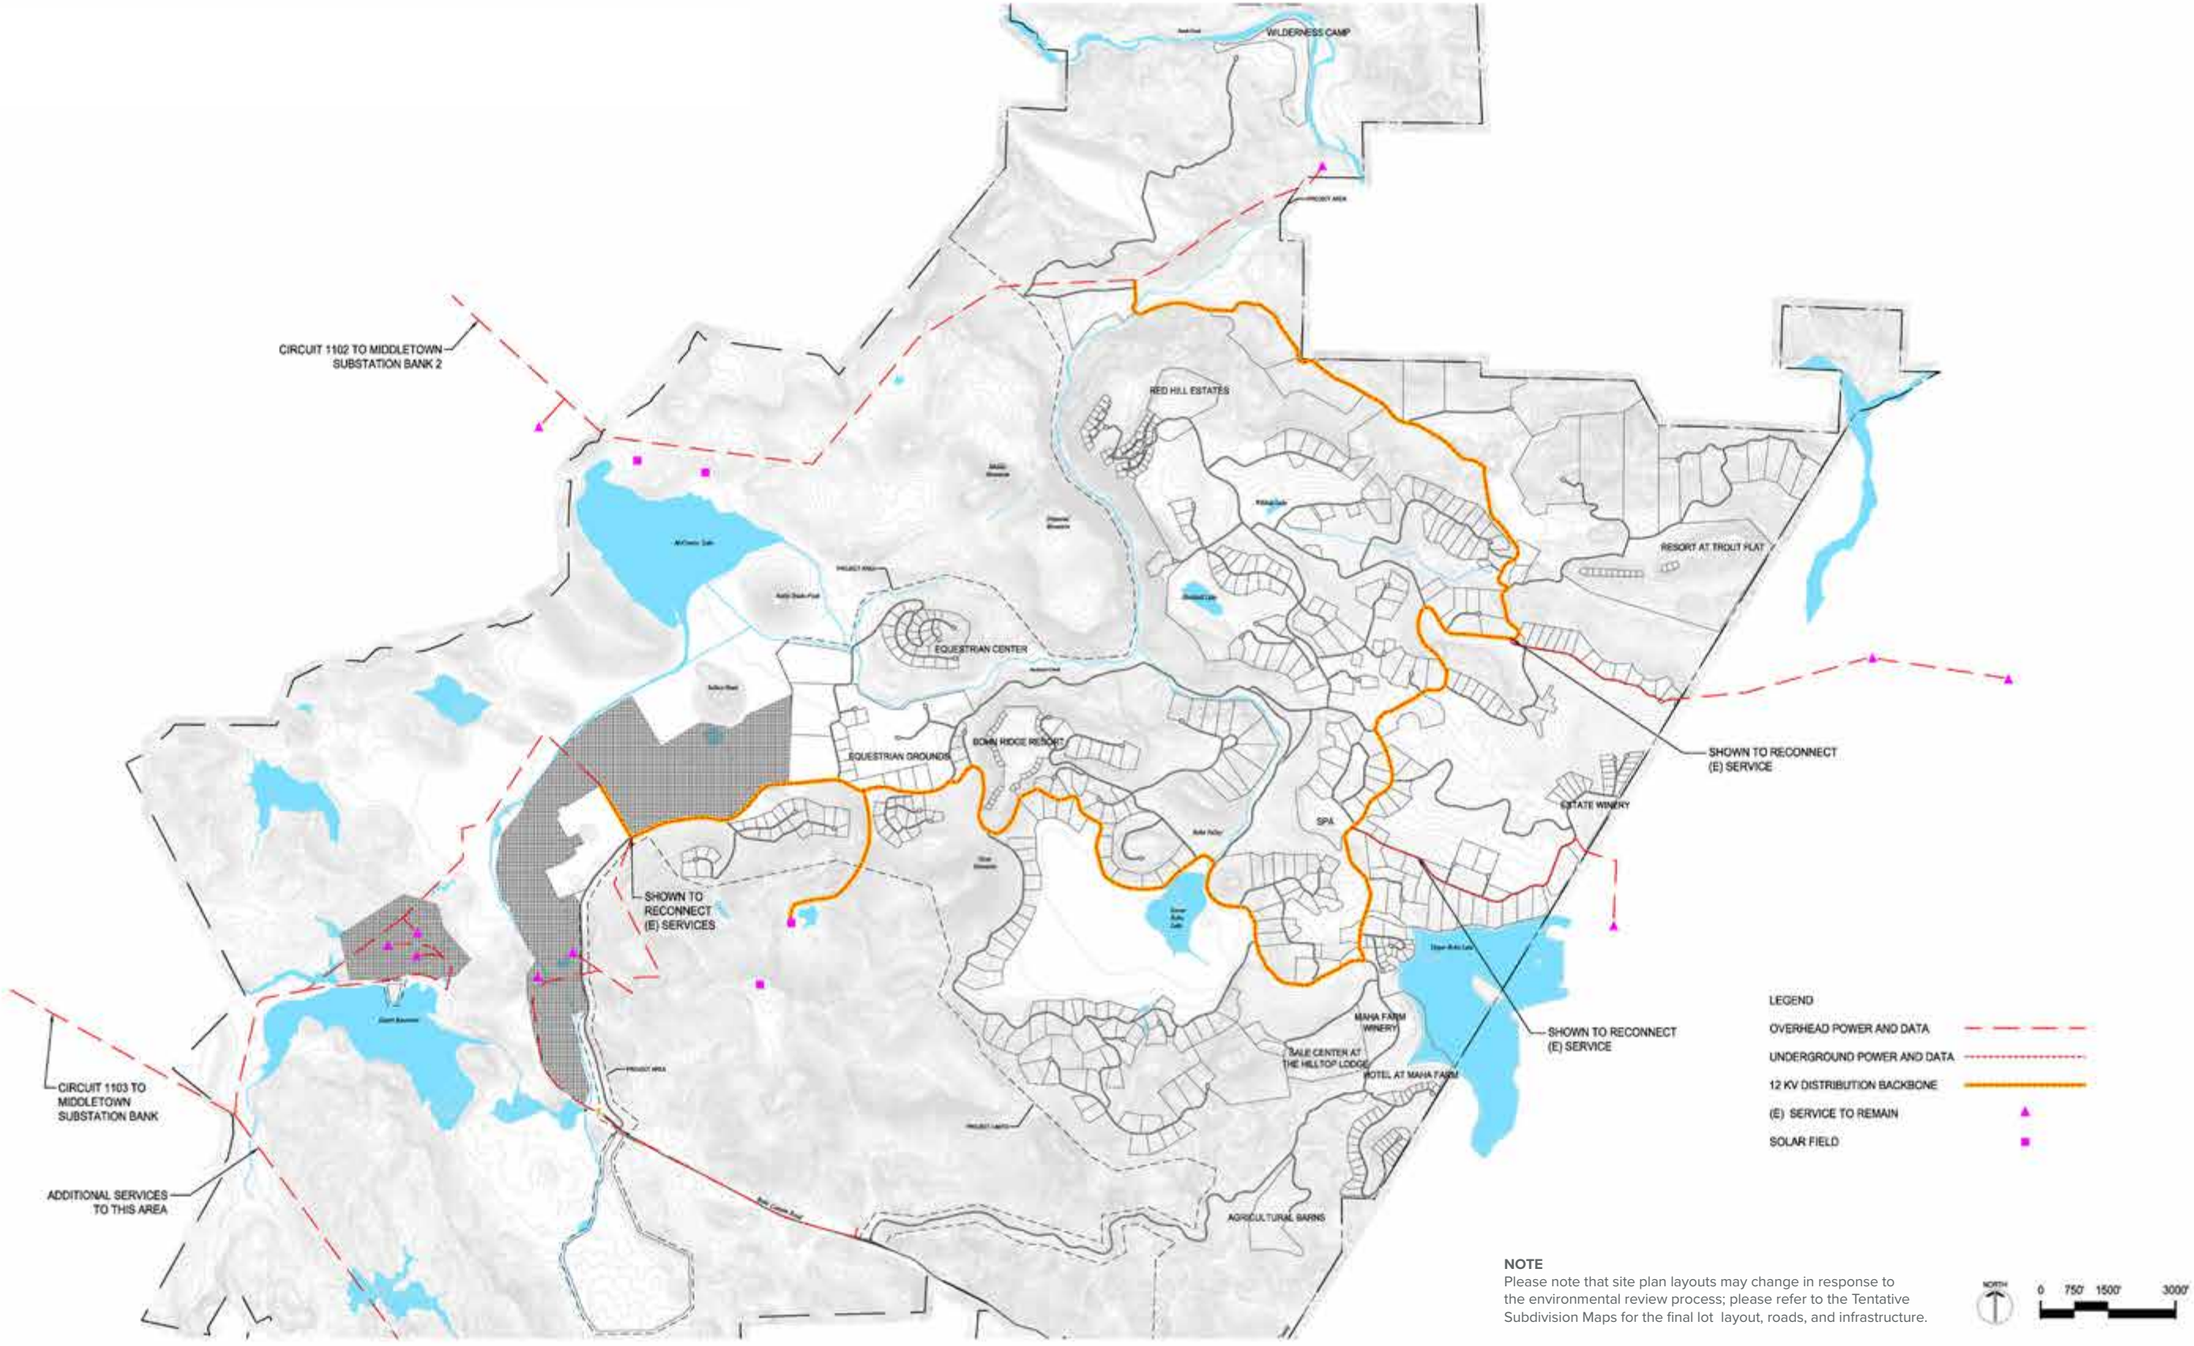


DRY UTILITIES PROPOSED 12KV DISTRIBUTION

The location of the proposed electric substations and the alignments of the 12kV power line easements will coincide with plan elements. The proposed alignment requires the purchase of PG&E facilities within the development for buildings served by PG&E within the development. The current PG&E circuits serving the property have adequate capacity to meet the demands of the development.



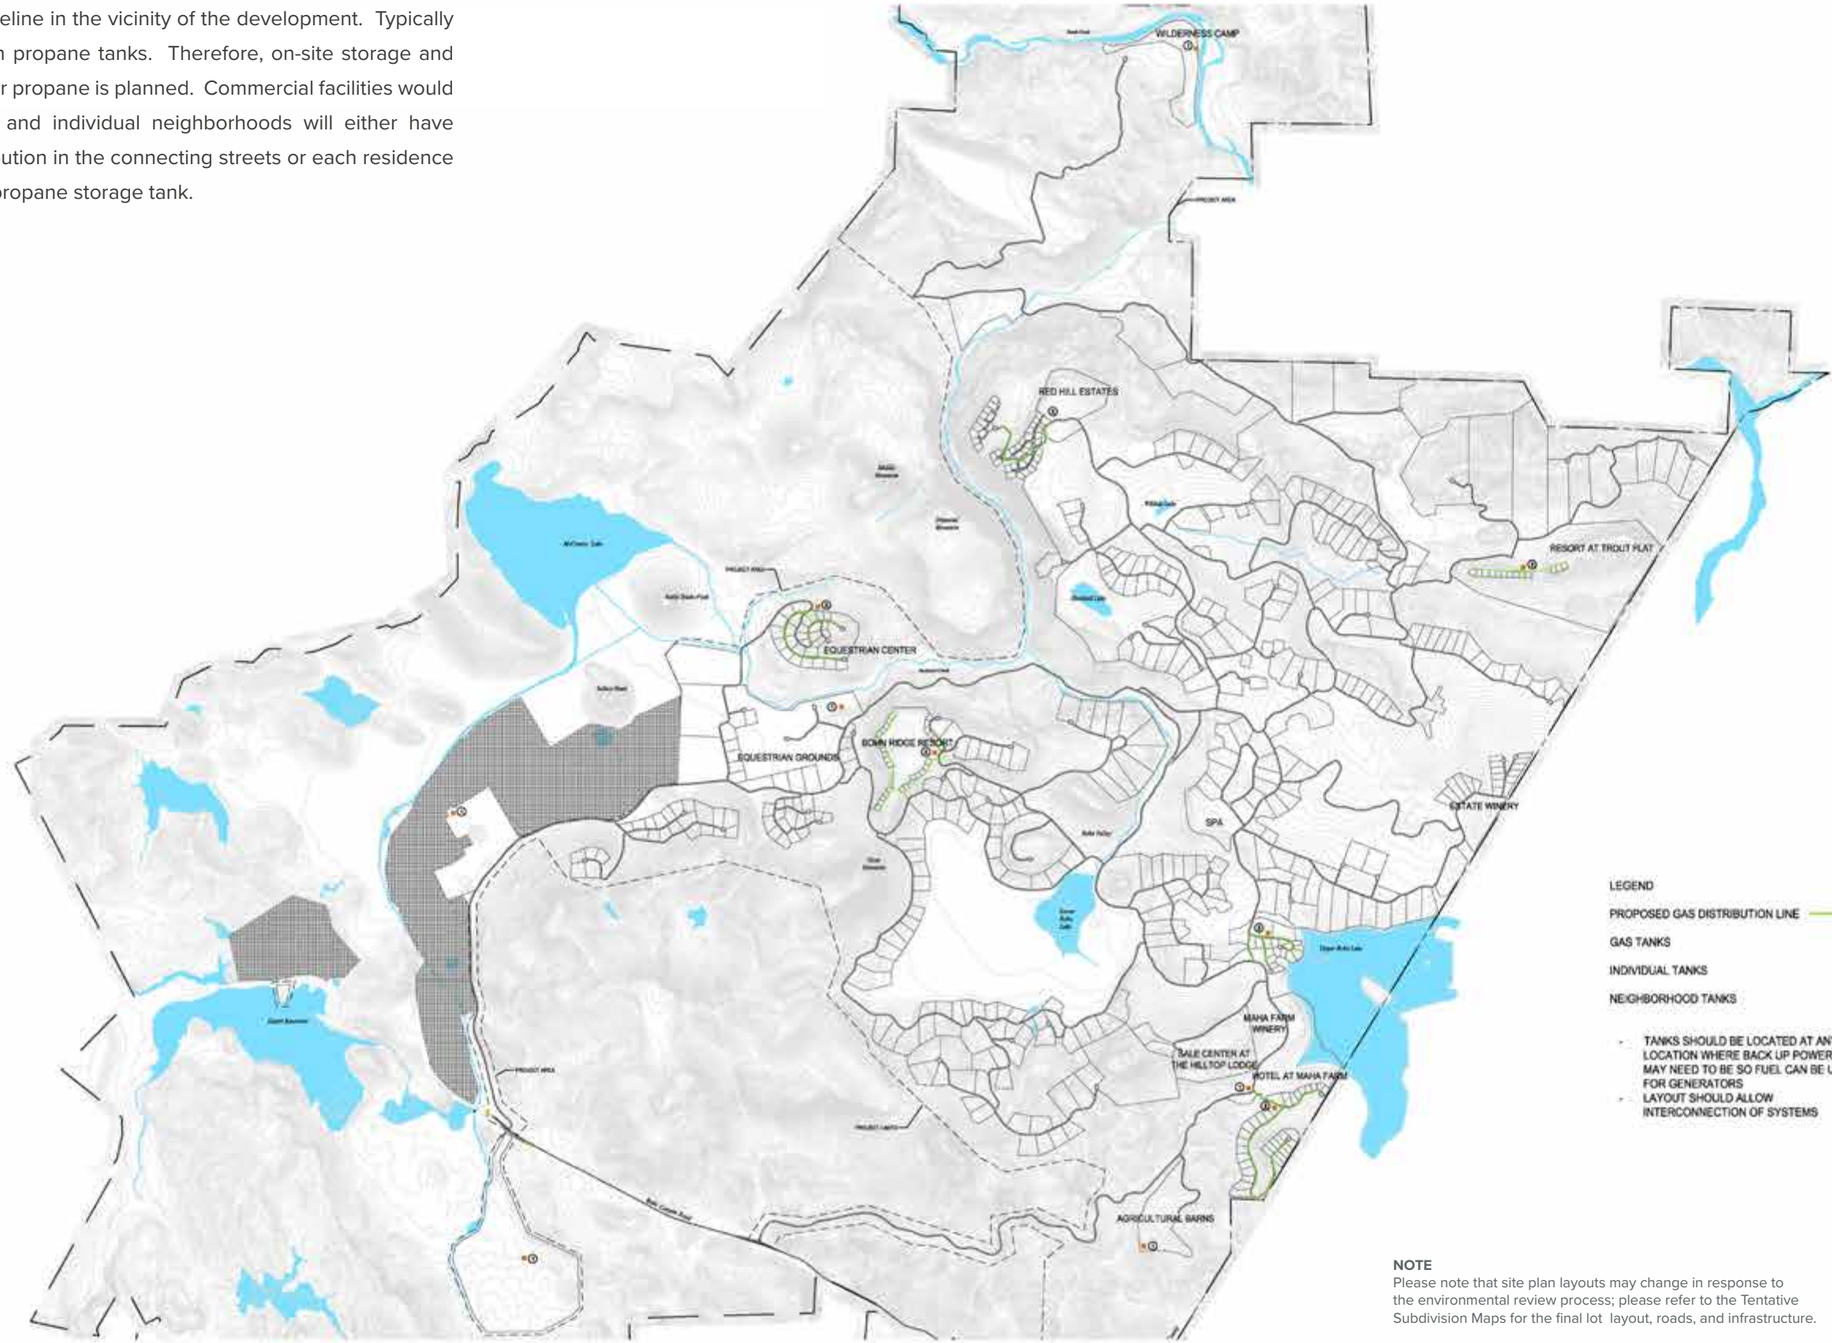
DRY UTILITIES PROPOSED 12KV UNDERGROUND BACKBONE



NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

DRY UTILITIES PROPOSED GAS DISTRIBUTION

There is no natural gas pipeline in the vicinity of the development. Typically rural developments rely on propane tanks. Therefore, on-site storage and distribution of natural gas or propane is planned. Commercial facilities would have centralized facilities and individual neighborhoods will either have central facilities with distribution in the connecting streets or each residence would be provided with a propane storage tank.



NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and infrastructure.

NORTH 0 750' 1500' 3000'

COMMUNICATIONS PROPOSED IT NETWORK

A combination of fiber and wired lines, or an equivalent, for cable and internet will be included in the joint trench. Distribution lines to individual parcels will be extended from new infrastructure and will occur as development takes place. In addition, we are proposing a cell phone tower.

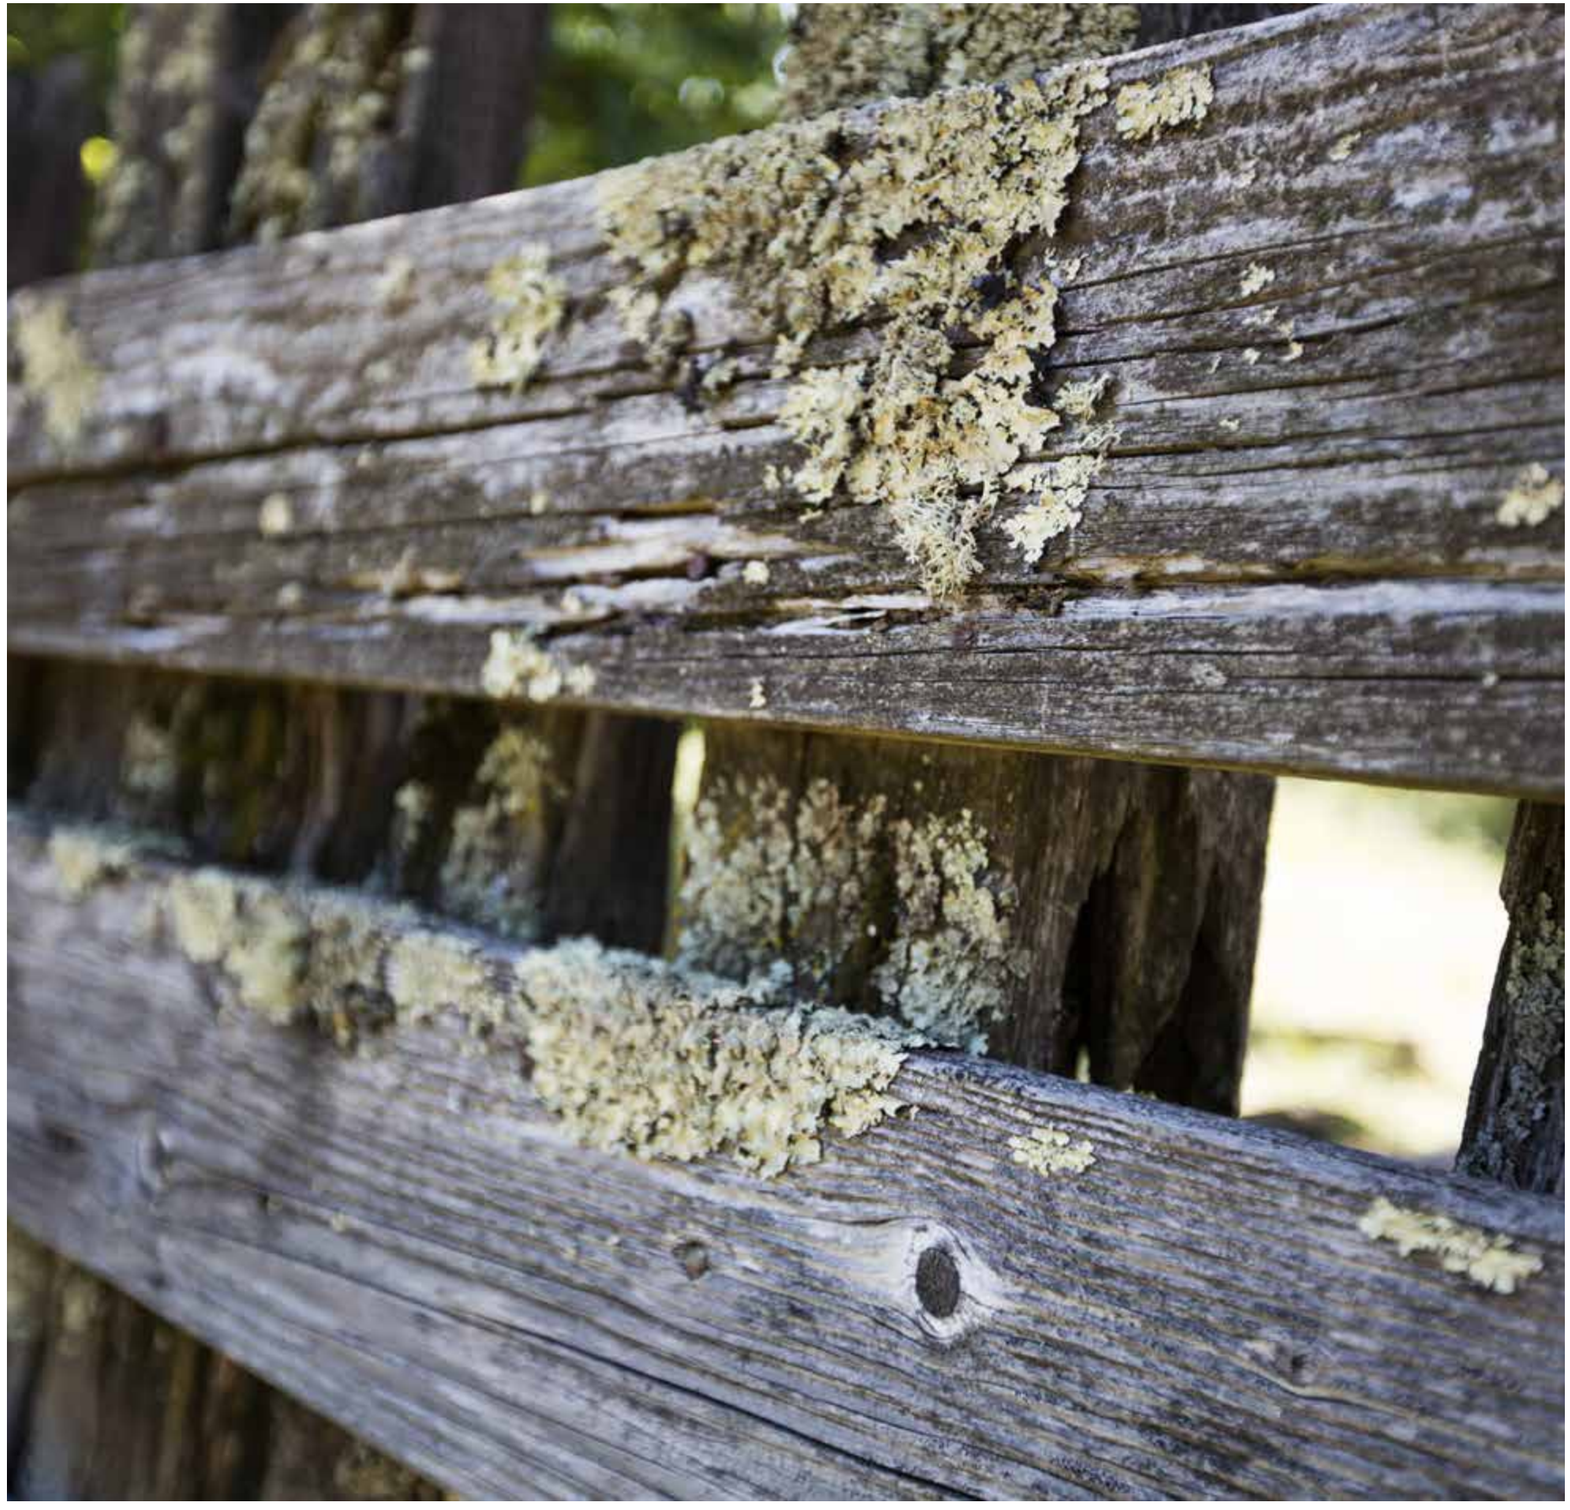
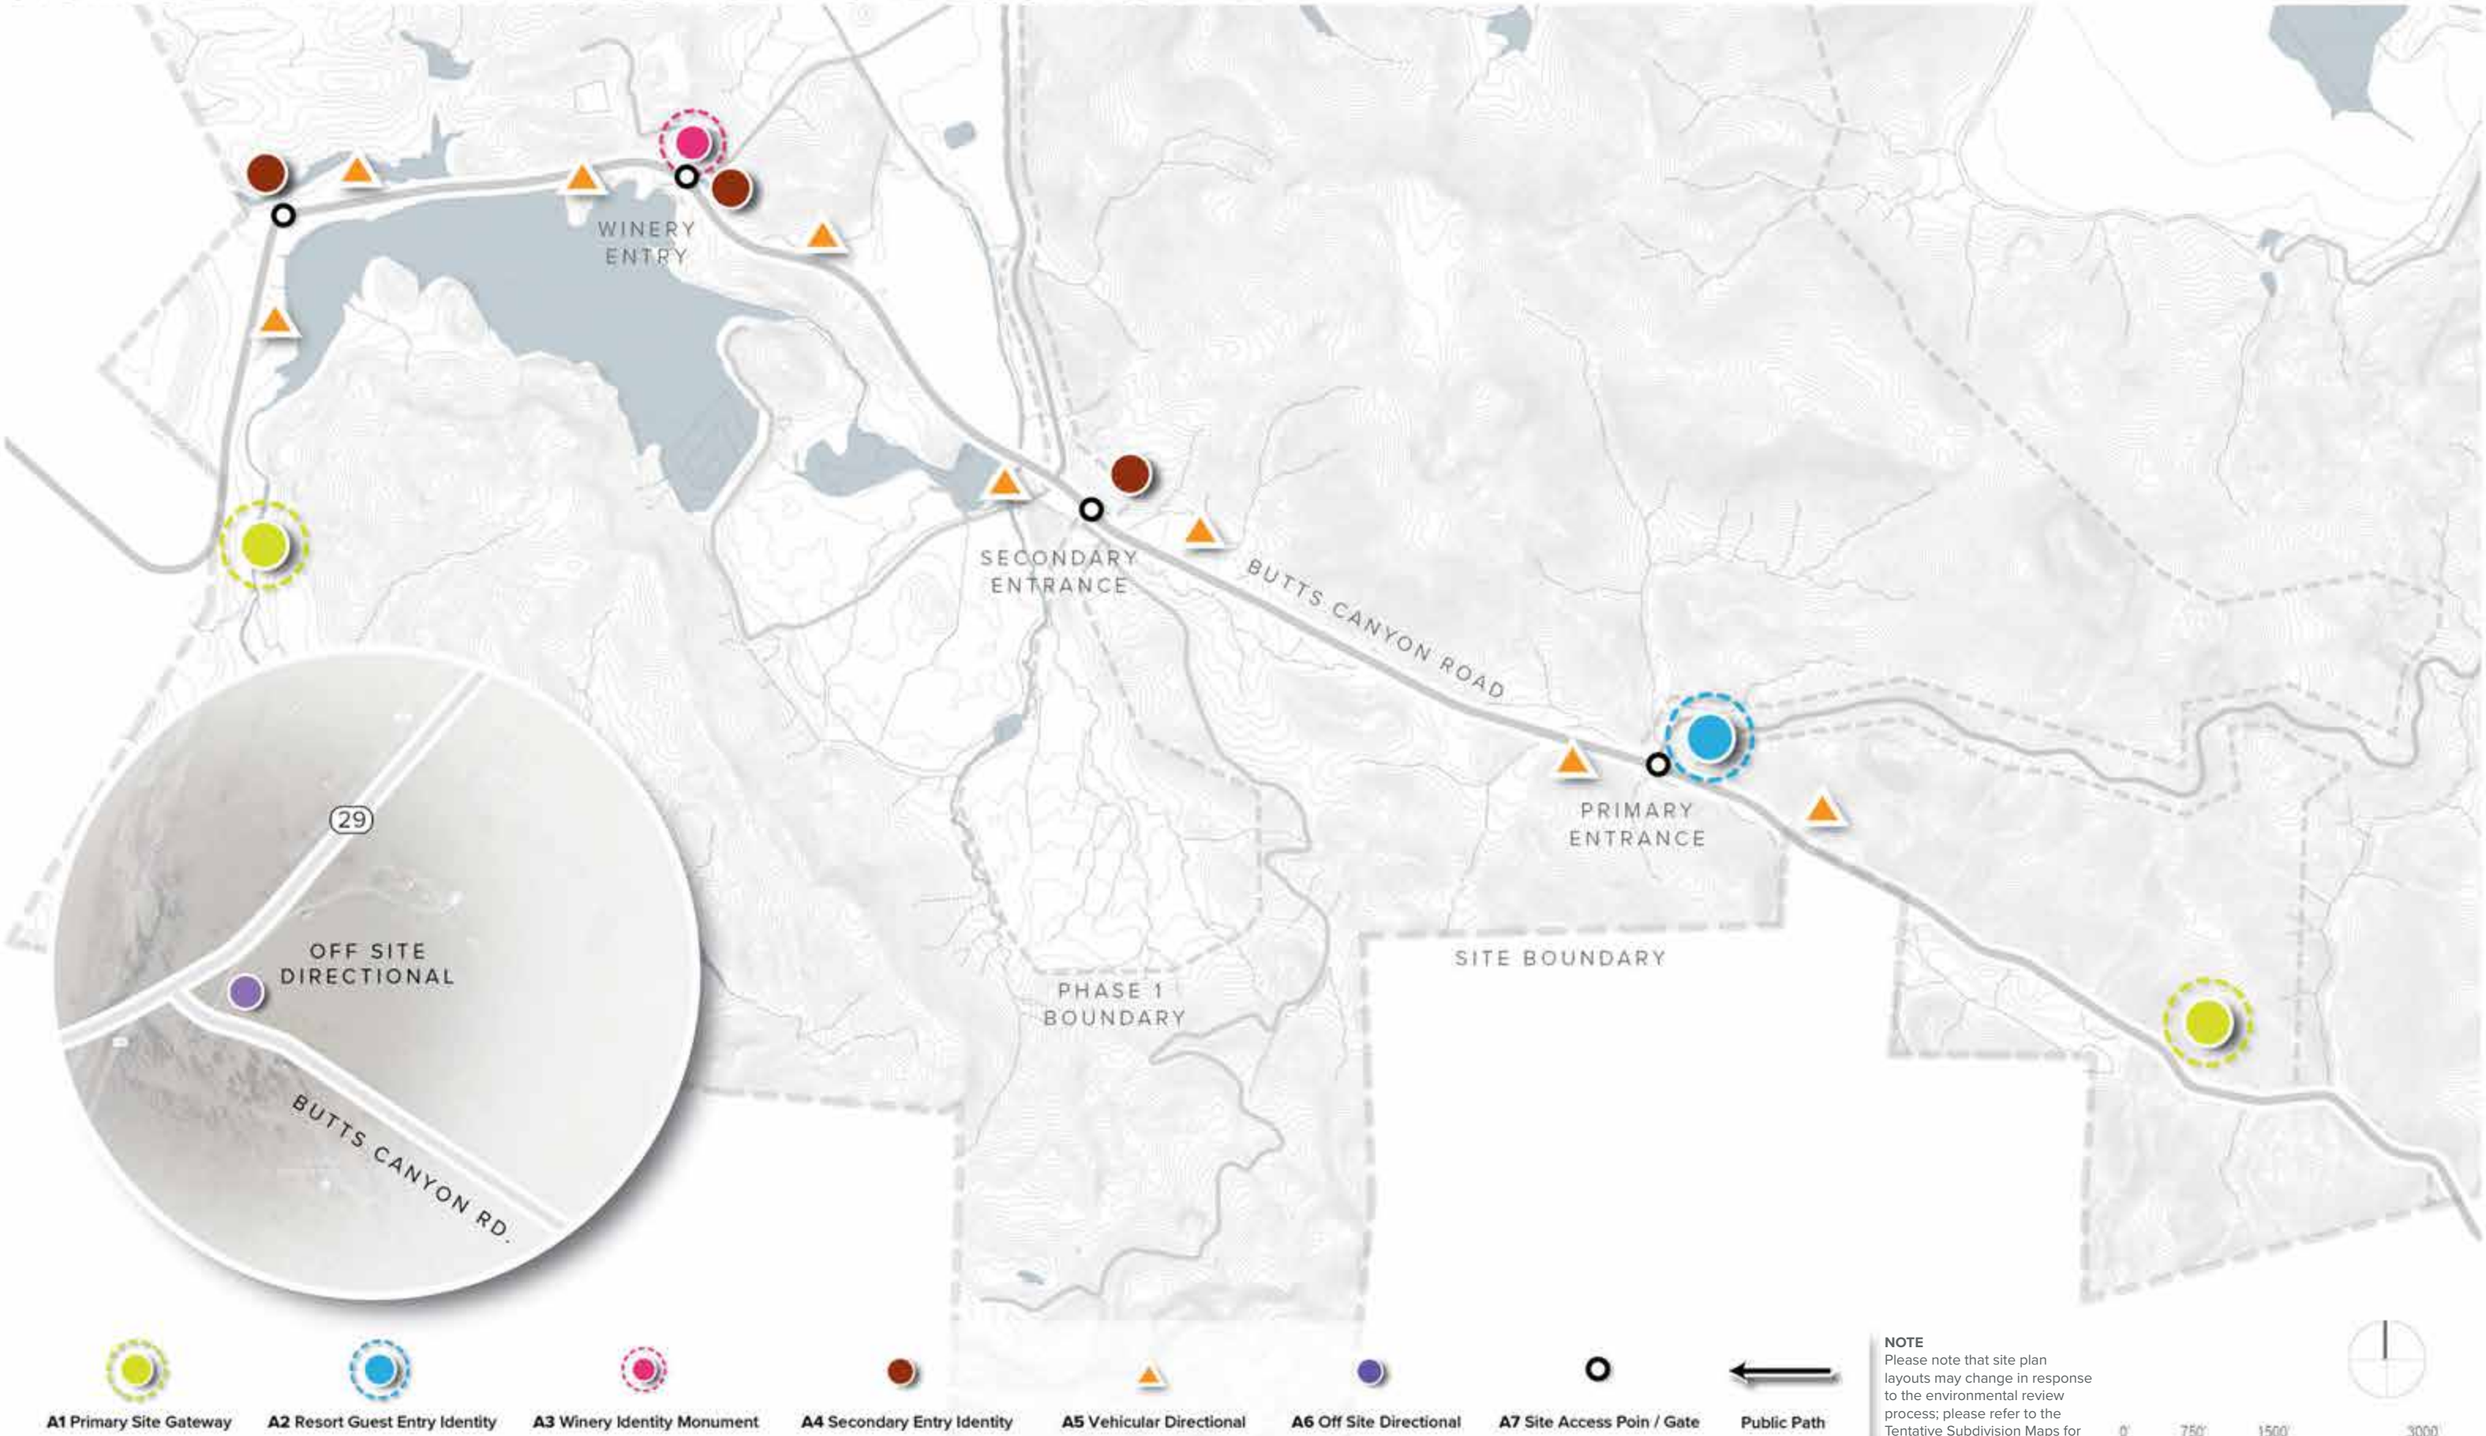
SECTION 6 PUBLIC STREETSCAPE

SIGNAGE & WAYFINDING AND FENCING

The following exhibits represent the project intentions on the aspects that are visible from the public right of way. Further detail for internal regulation of development, materials, intentions will be expanded within the Maha Design Guidelines for Guenoc Valley, forthcoming under separate cover. All fencing and signage visible to the public will adhere to the following concepts presented here.



SIGNAGE & WAYFINDING CONCEPTUAL LOCATION PLAN



NOTE
Please note that site plan layouts may change in response to the environmental review process; please refer to the Tentative Subdivision Maps for the final lot layout, roads, and

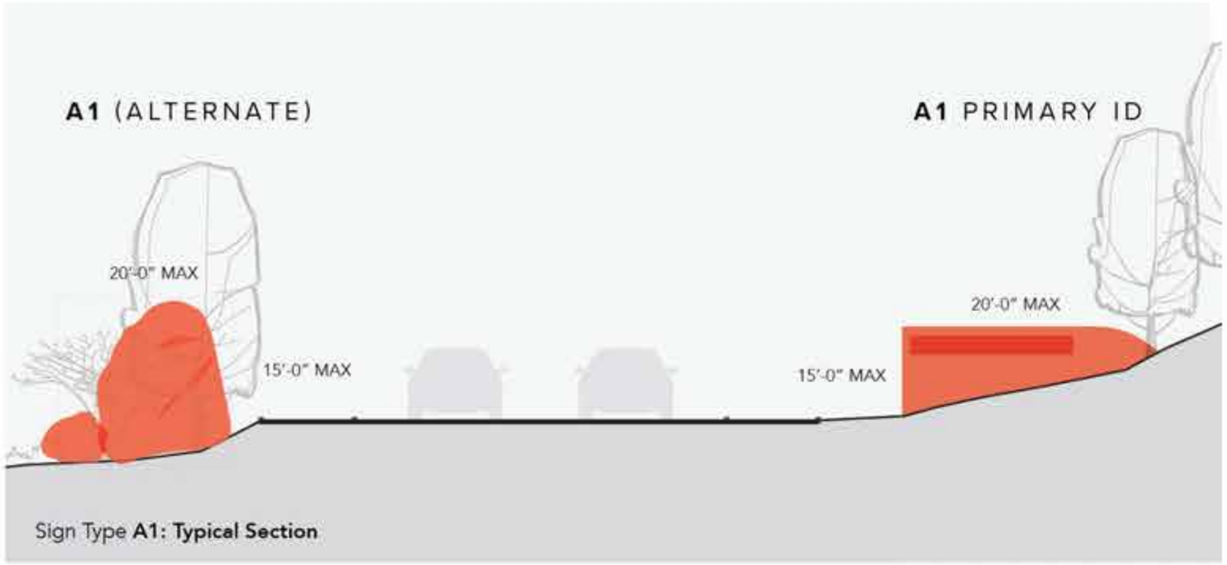
** **A7 Entry Gate not included in total quantity & total sign area.**

SIGNAGE & WAYFINDING PROJECT IDENTITY CONCEPTS

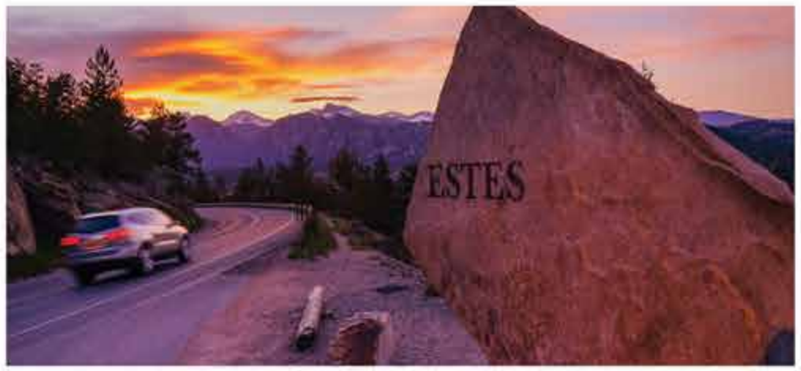


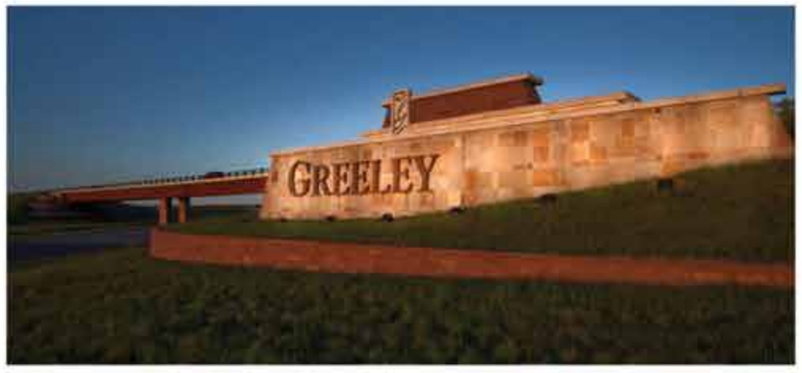
Sign Type **A1: Typical Section**

A1 PRIMARY SITE ENTRY

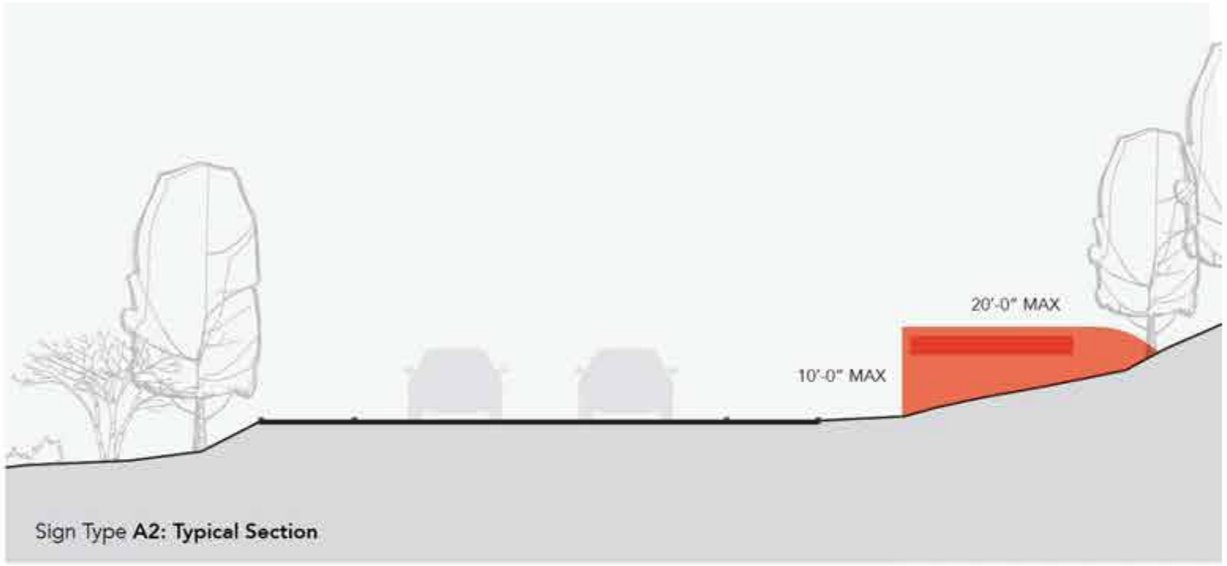
Height	15'-0" max
Width	20'-0" max
Area (SqFt)	200 SqFt max
Logo / Copy Ht.	Sculptural: 6'-0" max Non Sculptural: 3'-0" max
Quantity	2
Illumination	Internal or External

The Primary Site Entry signage acts as a welcoming identification for guests arriving to the site. Larger in scale, this project monumentation along Butts Canyon Road demarcates the project boundaries. These signs are the lead element in the hierarchy of graphics on site. Sign locations, that optimize visibility and impact, will be integrated into the roadway landscaping and topography. Materials, illumination, and other design details will relate directly to the brand vision and site architecture. A sculptural art program may also act as a series of landmarks, elevating the location and inviting the community to come enjoy.





SIGNAGE & WAYFINDING RESORT ENTRY IDENTITY CONCEPTS

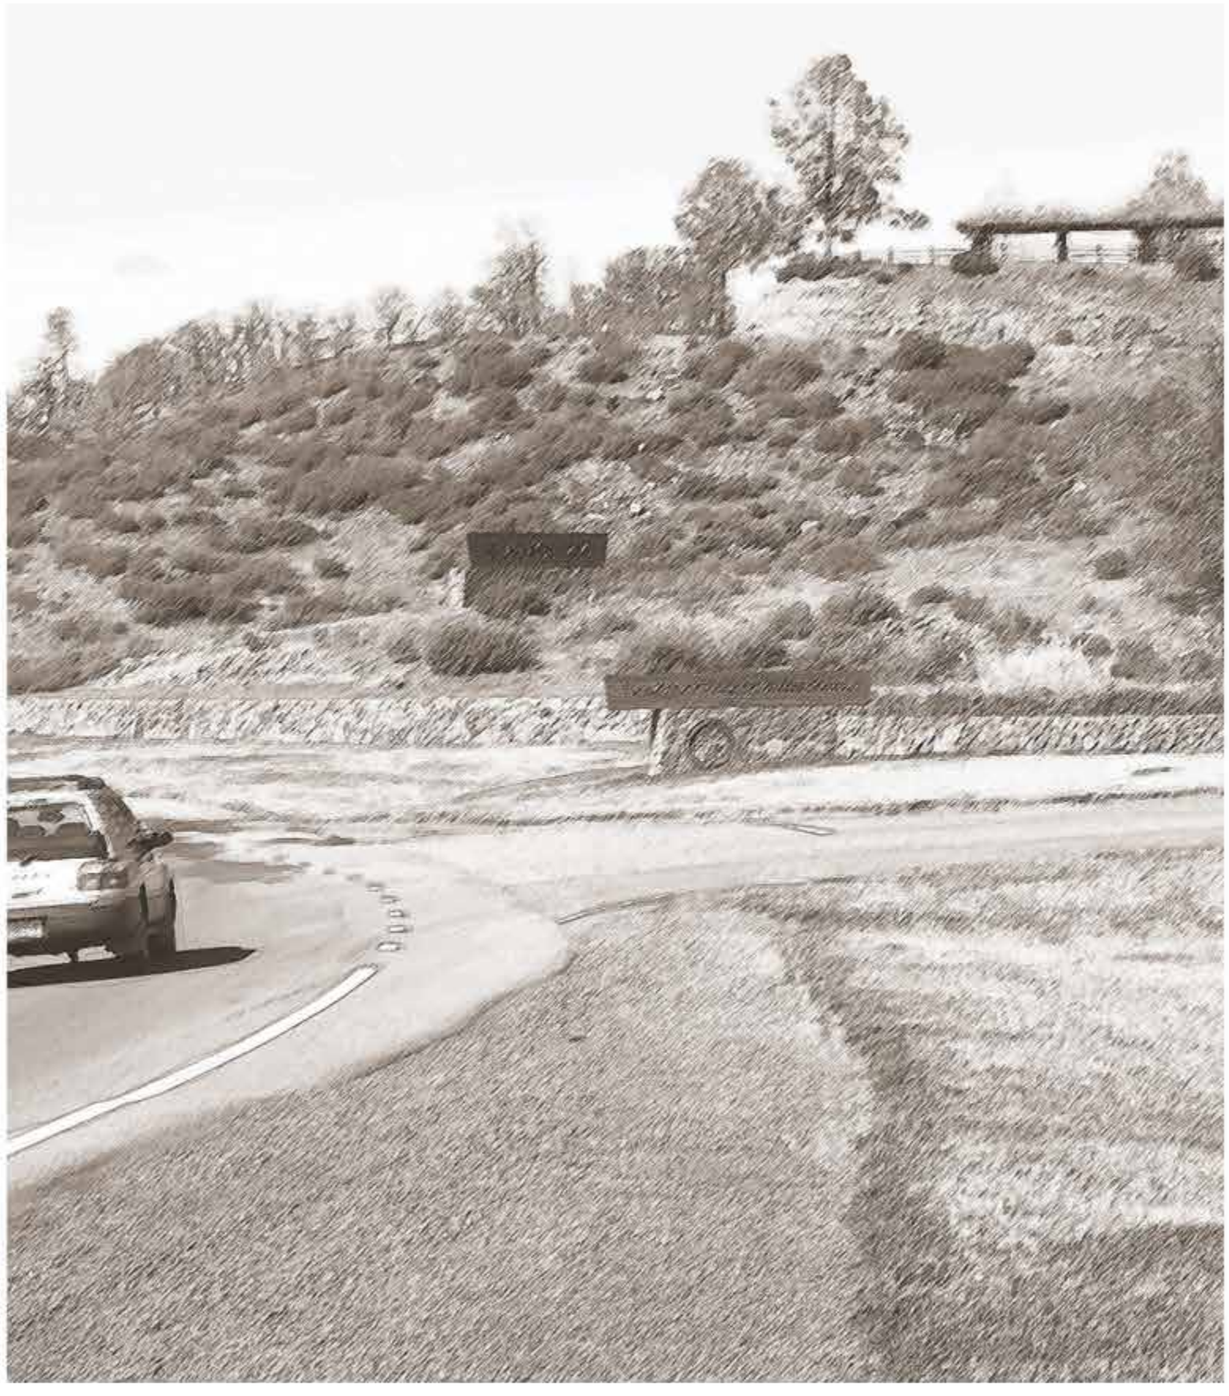


Sign Type **A2: Typical Section**

A2 RESORT GUEST ENTRY IDENTITY

Height	10'-0" max
Width	20'-0" max
Area (SqFt)	200 SqFt max
Logo / Copy Ht.	Logo: 24" max Address: 6" max
Quantity	1
Illumination	Internal or External

The Resort Guest Entry Identity sign is located at the main guest entry on Butts Canyon Road. This sign establishes a "sense of arrival" and clearly communicates the project identity and address, while establishing an expectation of quality.

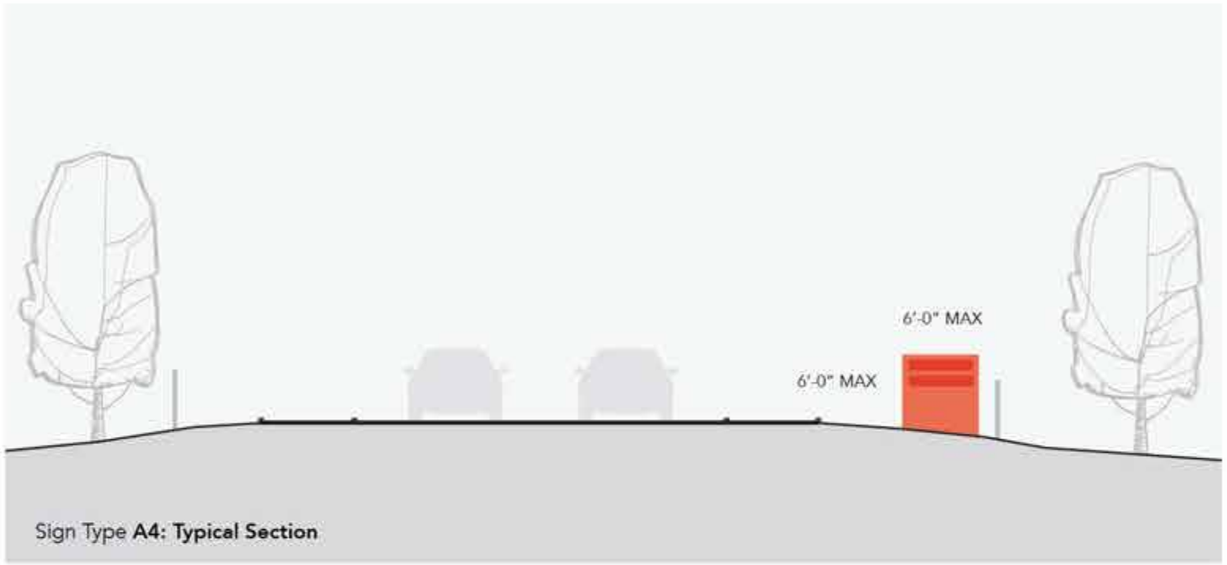


A3 WINERY ENTRY IDENTITY (EXISTING TO REMAIN)

Height	TBD
Width	TBD
Area (SqFt)	TBD
Logo / Copy Ht.	Logo: 18" max Address: 6" max
Quantity	1
Illumination	Internal or External

The existing Langtry Estate & Vineyards signage vocabulary is specific to the Langtry Estate and may differentiate the Vineyard as it's own entity within the broader Maha resort.

Project ownership to confirm, existing signage to remain, or signage will be redesigned consistent with the design vocabulary used throughout the Maha site signage.



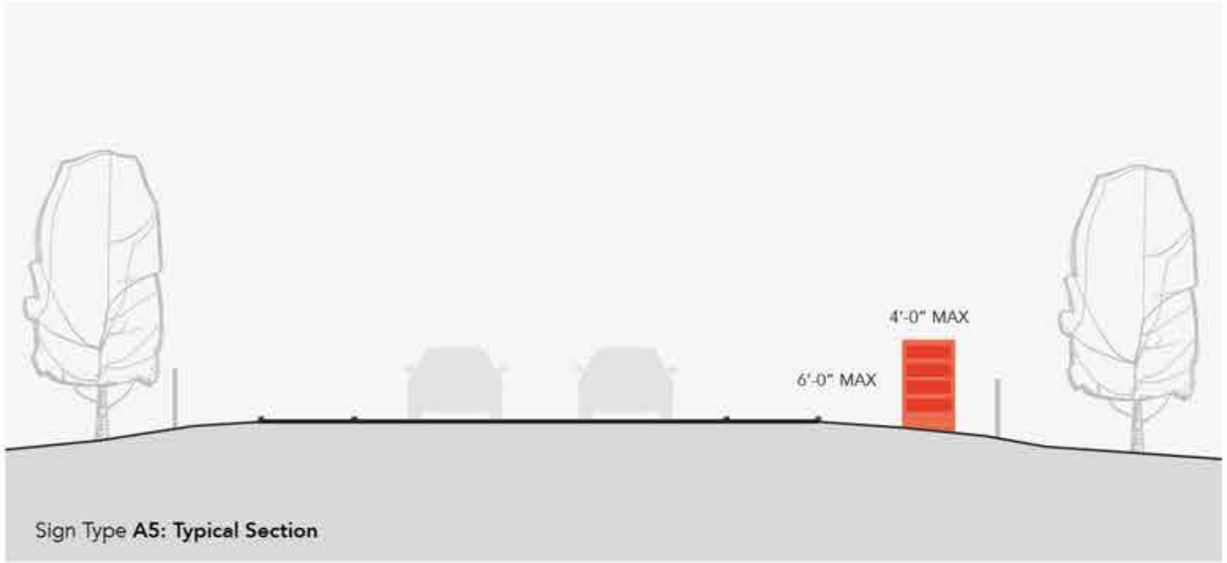
Sign Type **A4: Typical Section**

A4 SECONDARY ENTRY IDENTITY

Height	6'-0" max
Width	6'-0" max
Area (SqFt)	36 SqFt max
Logo / Copy Ht.	Logo: 18" max Copy / Address: 6" max
Quantity	3
Illumination	Internal or External

The Secondary Entry Identity is located at the alternate entrances to the resort property. It is understated when compared to the Primary Guest entrance and its primary function is to direct residents, deliveries, and staff to the proper points of entry.

SIGNAGE & WAYFINDING VEHICULAR DIRECTIONAL CONCEPTS



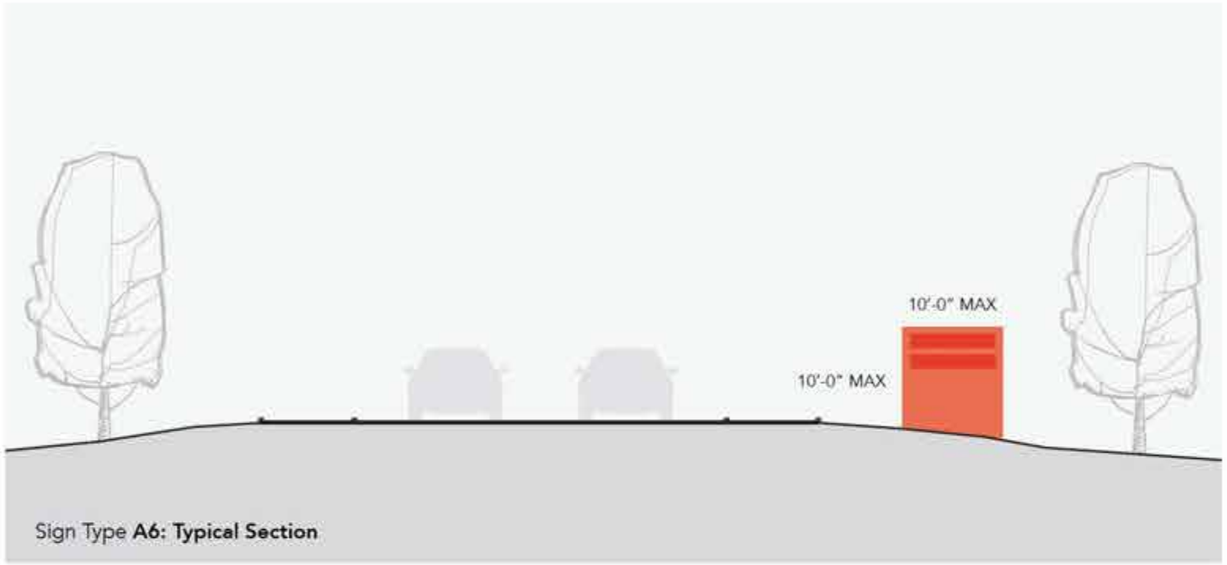
Sign Type **A5: Typical Section**

A5 VEHICULAR DIRECTIONAL

Height	6'-0" max
Width	4'-0" max
Area (SqFt)	24 SqFt max
Logo / Copy Ht.	Directional Copy: 6" max
Quantity	8
Illumination	Internal or External

The Vehicular Directional sign facilitates movement throughout the site by connecting important points along the primary path of arrival. Sign locations will anticipate decision making points, insuring that guests can read and have time to respond while driving. Strong legibility will be achieved through high contrast letter forms and appropriately sized text and arrows for the speed of travel along Butts Canyon Road.

SIGNAGE & WAYFINDING POTENTIAL OFF SITE DIRECTIONAL CONCEPTS



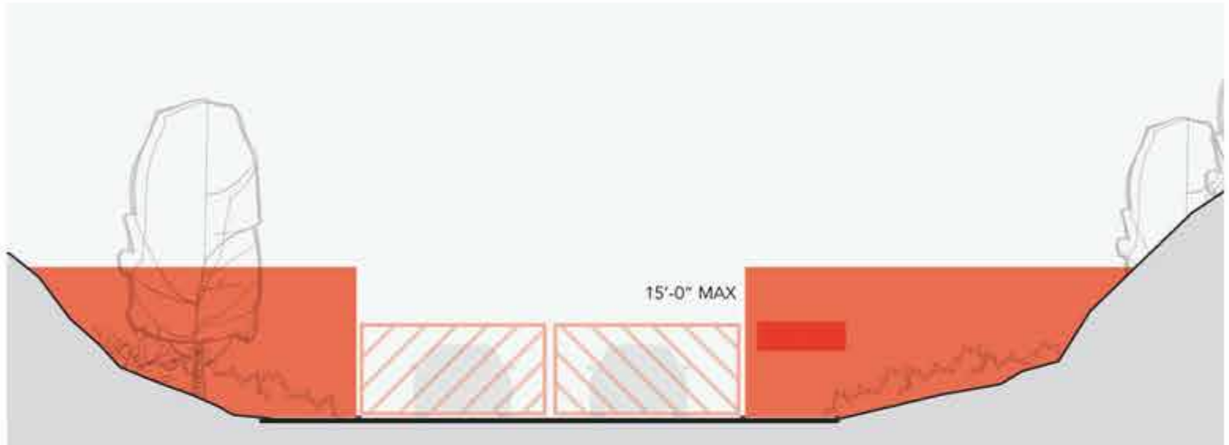
Sign Type **A6: Typical Section**

A6 OFF SITE DIRECTIONAL IDENTITY

Height	10'-0" max
Width	10'-0" max
Area (SqFt)	100 SqFt max
Logo / Copy Ht.	Logo: 18" max Directional Copy: 8" max
Quantity	1
Illumination	Internal or External

The Off Site Directional Identity acts as a welcoming signal for guests arriving to site. The primary purpose of this sign is to direct guests down Butts Canyon Road towards the resort entries. Larger in scale, this project identification and directional signage sits at the intersection of Butts Canyon Road and Highway 29.

SIGNAGE & WAYFINDING RESORT ENTRY GATE CONCEPT

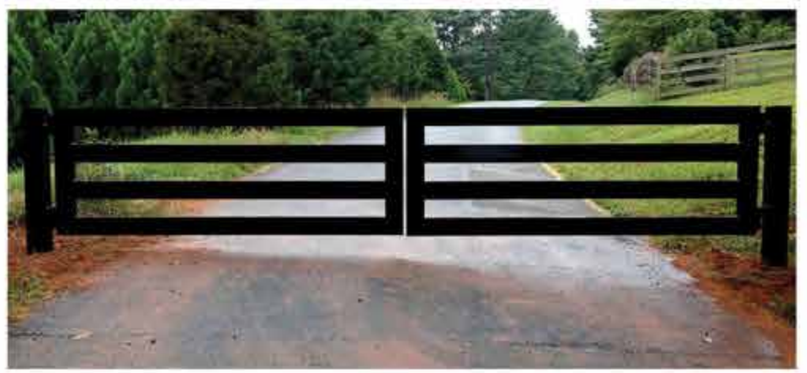


Sign Type **A7: Typical Section**

A7 RESORT GUEST ENTRY GATE

Height	15'-0" max
Width	TBD
Area (SqFt)	TBD
Logo / Copy Ht.	Logo: 24" max Address: 6" max
Quantity	1
Illumination	Internal or External

The Resort Entry Gate is located approximately 50'-0" from Butts Canyon Road at the main site entry. This gate establishes a "sense of arrival" and clearly communicates the project entry and complies with the code for a gated entry on private roads.



STREET SIGNS & REGULATORY

Street name and regulatory signs may be posted at intersections, and are usually perpendicularly oriented pairs identifying each of the crossing streets. Public streets must follow design requirements per city code.

MILE MARKERS & FIRE SAFETY

Mile Markers and Fire Safety signs will be posted as required per local code. These signs will be designed to fit within the overall brand vocabulary and are intended to assist motorists, pedestrians, and the Fire Authority.

FENCING CURRENT LOCATION & STYLE

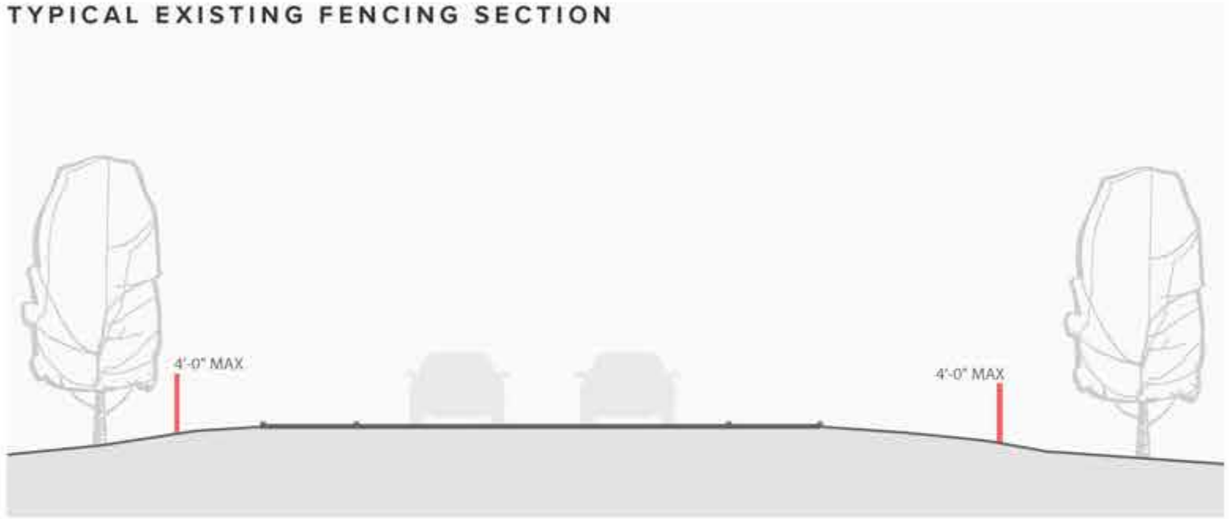
FENCING POTENTIAL FENCE TYPES VISIBLE FROM THE PUBLIC STREETSCAPE

TYPICAL EXISTING FENCING SECTION



EXISTING AND POTENTIAL FENCING CONDTION

Three types of fence are currently visible along Butts Canyon Road within the project site: white fencing, wire fencing, and stone fencing. These fence edges currently offer a distinct demarcation of the project site.

These fences may remain or eventually be replaced by three potential fence types: post and rail fencing, wire fencing, and stone and landscape edging. Any fence replacement will be maximum 4 feet tall, which follows standards set by Lake County's Fences, Hedges and Walls code. Potential new fence locations and styles will be closely integrated with the existing landscape and topography along Butts Canyon Road. Any introduced changes to fencing will improve site identity for passerbys and the arrival experience for guests.

APPENDICES

Appendix A – NOAA Precipitation Frequency Table

OBJECTIVE

The objective of this report (The Report) is to provide an overview of the stormwater management design criteria as related to the 21000 Santa Clara housing project and tentative subdivision (The Project). This report includes analysis of the development types, approximate quantities of proposed impervious area, and other stormwater design considerations. In addition, this Report includes a description of the existing site conditions and addresses methodology for meeting post-construction mitigation requirements in compliance with cuttent State and Federal requirements.

PRIMARY DESIGN CRITERIA

As of the writing of this Report, Lake County has not published approved Phase II, Municipal Separate Storm Sewer System (MS4) permit guidelines and in practice defers to State requirements associated with the General Construction Permit for post-construction stormwater mitigation. In meetings with representation of the Lake County Public Works Department, this Project is designed to the requirements the Bay Area Stormwater Management Agencies Association (BASMAA) guidelines, which have been adopted in neighboring Marin, Sonoma, Napa, and Solano Counties and comply with State and Federal NPDES requirements. Therefore, the following report references the Bay Area Stormwater Management Association (BASMAA) guidelines.

The Project's Goals:

- Comply with regionally adopted Phase II MS4 guidelines (BASMAA), and
- Show all runoff from impervious areas as routed to an engineered Low Impact Development (LID) treatment facility.

EXISTING SITE CONDITIONS AND FEATURES

The Project is located on an undeveloped and relatively flat approximately 12.75 acre parcel that is majorily covered in grassland. It is located to the east of Highway 175 in central Middletown within South Lake County. The area is bounded on the western edge by a perennial stream named Dry Creek, on the northern edge by undeveloped land, and on the south and east by medium density residential development. Although the site is mainly flat, it generally drains to the west and into Dry Creek.
The Project is located adjacent to the Floodway and within the flood zone. Western portions of the Project site are in Floodzone AE and the remainder of the Project is within Floodzone AO. All building finished floor elevations have been coordinated with the floodzone administrator to be set sufficiently above the flood elevation. See **Figure 1** for the existing site limits.

SITE CONDITIONS AND PROPOSED TREATMENT

The Project is a residential development with a total of 49 residential parcels resulting in 28 duplex and 21 single family residential units and a community center, for a total of a 50 lot subdivision. This Project will be connected with a single access road to create a loop, connecting all of the residential parcels. There will also be a parking lot associated with the community center.

To provide treatment of the stormwater there will be a series of LID facilities thoughout the development. These will consist of small raingardens, located adjacent to each residential parcel, and a few treatment/detention basins (See Figure 1). The raingardens will serve to treat the roof and residential driveway areas, and will slow down the flows from these portions of the site, allowing for a longer travel times . These raingardens will overflow into a gutter along the roadway prior to discharging into two treatment and detention basins, one located in the center and the other at the west end of the development. (See **Figure 1)**

See **Table 1/below** for hardscape and softscape acreage breakdown.

Table 1 - 2-year 24-hr Storm

Zone	C*	Area (sqft)	Area (acre)	Intensity** (in/hr)	Flow (cfs)	Flow (gpm)	Volume (gal)
Hardscape	0.98	281,854	6.47	0.19	1.23	551.51	794,168
Landscape	0.4	171,533	3.94	0.19	0.31	137.00	197,273
-Raingarden		14,147	0.32				
-Stormwater Treatment Basin		14,552	0.33				
Total Area		453,387	10.41		**1.54**	**688.50**	**991,441**

*** Runoff Coefficient**

**** Intensity per NOAA Rainfall Table see Appendix A**

SUMMARY

The Project totals approximately 10.4 acres of which approximately 6.5 acres is impervious area within a 12.75 acre site. The site includes 0.33 acres of treatment and detention basins and 0.32 acres of raingardens. BASMAA requires the square footage treatment areas to total at least 4% of the new hardscape of within a site, which amounts to 0.26 acres of treatment for the Project. This treatment requirement is achieved through the treatment basins alone. To provide additional treatment, beyond the BASMAA requirements, raingardens will serve to collect and treat water from each of the residential parcels, including the roofs and portions of the driveways and hardscape, which account for approximately 3 acres of the total site hardscape. This combination of raingardens, treatment and detention facilities provides 2.5 times the required treatment area set by the regionally accepted BASMAA guidelines in compliance with Phase II MS4 permits.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Appendix A – Commercial Area Drainage Management Areas (DMAs)

OBJECTIVE

The objective of this report is to provide an overview of the stormwater management design criteria as related to the first phase of the proposed MAHA Resort at the Guenoc Valley, as defined in the Specific Plan of Development ("The Project"). This report includes development types, approximate quantities of proposed impervious area, and other stormwater design considerations including descriptions of the existing site conditions and dominant drainage patterns and methodologies for meeting post-construction mitigation requirements in compliance with State and Federal requirements.

PRIMARY DESIGN CRITERIA

As of the writing of this report, Lake County has not adopted approved Phase II, Municipal Separate Storm Sewer System (MS4) permit guidelines and defers to State requirements associated with the General Construction Permit for post-construction stormwater mitigation. In meetings with representation of the Lake County Public Works Department, this project has proposed designing to the requirements the Bay Area Stormwater Management Agencies Association (BASMAA) guidelines[1], which have been adopted in neighboring Marin, Sonoma, Napa, and Solano Counties and comply with State and Federal NPDES requirements. Accordingly, the following references BASMAA guidelines.

In general, The Project will be designed to minimize disturbance to existing drainage patterns and to improve runoff quality at every opportunity. While the existing site is largely undeveloped, decades of livestock grazing and vineyard farming operations have created conditions that will benefit from improved runoff management strategies and restoration efforts associated with The Project.

The Project's Goals:

- Comply with regionally adopted Phase II MS4 guidelines (BASMAA)
- No Hydromodification - No increase in peak flow rate for up to the 2-year 24-hour storm.
- Minimize impact of development to receiving waters. Improve upon existing conditions where feasible.
- Mitigate impacts to existing drainages.

The above goals will be achieved through a range of strategies including:

- Selection of materials that encourage infiltration rather than runoff
- Improved runoff quality by flowing hardscape runoff through constructed bio-treatment areas prior to discharge to existing drainage pattern
- Use of undisturbed existing landscape and vegetation to treat runoff
- Design conveyances to return collected runoff to sheet flow over undisturbed landscape rather than concentrated discharges
- Continue to collect runoff in existing lakes/ponds for use in vineyard and landscape irrigation

1. Bay Area Stormwater Management Agencies Association (BASMAA), *BASMASS Post-Construction Manual: Design Guidance for Stormwater Treatment and Control for Projects in Marin, Sonoma, Napa, and Solono Counties,* January 2019.

EXISTING SITE CONDITIONS AND FEATURES

The Project, comprised of 49 assessor's parcels totaling approximately 16,000 acres within Guenoc Valley, is located three miles southeast of Middletown on the southeast border of Lake County, bordering Yolo and Napa Counties to the south and east with primary access along Butts Canyon Road. The area is broken into eight primary watersheds, which are bounded by Bucksnort Creek on the West, Putah Creek on the North, Upper Bohn Lake on the East, and Butts Canyon Road on the South. These watersheds are largely contained within the bounds of the project limits and discharge to ponds, drainages and creeks that eventually flow offsite to existing regional drainage patterns. See **Figure 1** for an overview of the overall watersheds that The Project will affect.

The Bucksnort Creek and Easter Peak Watersheds are composed of large areas of wooded hillsides which include drainages, gullies, and perennial streams. In addition, there are large areas of vineyards in the flat portion of Easter Peak Watershed. These drainages migrate water through the watersheds and into Bucksnort Creek. This creek starts on the southwest side of the property and flows north into McCreary Lake. From there Bucksnort Creek continues east through the site until it bends back north and eventually discharges into Putah Creek on the north edge of the property.

The Wilderness Watershed is located at the north tip of the property. This watershed is sparesly forested, hilly terrain which slopes steeply down to Putah Creek. Throughout this slope there are small drainages and multiple discharge points into the creek at the north of the watershed.

The Butcherknife Creek Watershed is located in the central and northern portions of the property. This watershed is composed primarily of grassed hills and oak woodlands, which sheet flow into a series of tributary drainages that converge in the center of the watershed at Butcherknife Creek. The creek flows north and discharges into Putah Creek.

The Trout Flat and Upper Trout Flat Watersheds are located at the east side of the property. They are composed of hillsides with loose soils and areas with erosion channels. These drainages generally flow from west to east and eventually discharge into Putah Creek beyond the eastern limits of the project.

The Upper Bohn Watershed is a half circle located in the center of the property on the east side. This small watershed flows into small drainages that discharge into Upper Bohn Lake.

The Bohn Valley watershed is located in the center of the property and drains to Lower Bohn Lake at the center. This roughly circular watershed is composed of medium to steep slopes which drain toward a vineyard planted at the flat basin above the lake. The slopes surrounding the watershed are heavily forested and have deep drainages.

The McCain Canyon and West McCain Canyon Watersheds are located in the southeast corner of the property. This watershed is domindated by steep slopes, which drain into McCain Creek. The creek flows south until it discharges into Butts Creek at the southern end of the property.

The Three Peaks and South Three Peaks Watersheds are located at the south and center of the property. This watershed is composed of steeply sloped and sparsely vegetated hillsides, which sheet flow into drainages throughout this portion of the property. The drainages converge at the south of the property and discharge into Butts Creek prior to flowing east.

The Bucksnort South Watershed is located on the south side of Butts Canyon Road. The main portion of this watershed is an abandoned golf course and is relatively flat. The south side of the watershed is a steep hillside that drains into small streams which flow through the old golf course area.

Lastly, there is a small watershed associated with the float plane dock. The Watershed for Float Plane Dock slopes from Butts Canyon Road into the Detert Reservoir.

PROPOSED SITE CONDITIONS

The Project will be a resort-residential clustered development dispersed across approximately 11,200 acres of land in Lake County, CA. The existing land use has primarily been farming and vineyard operations, which consist of large areas of planted vineyards and an extensive network of gravel ranch roads (approximately 61 acres). For the purposes of this analysis, the proposed development has been broken down into three types: roadways, residential villa parcels, and commercial areas. In order to minimize disturbance to the overall site hydrology, more intensive mitiation strategies will largely be focused at the denser commercial development sites rather than a network of conveyance and collection to large basins that treat multiple areas. By treating water close to the proposed development through land-based strategies, runoff is returned to the natural drainage pattern. See **Table 1** for watersheds and existing roads acreage breakdown.

Roadways

In order to minimize the impact to the undisturbed site, the roadway network being developed for the MAHA Resorts will primarily use the alignments of the existing network of ranch roads, upgrading and widening them to paved roads to meet County requirements. The proposed roadway network will have a total acreage of approximately 150 acres and is dispersed throughout the entire development, producing minimal increase to hardcape and runoff at any specific location. Runoff from roads will be collected into roadside swales and ditches which will convey stormwater to small sediment forebays prior to entering culvert crossings (where necessary) and being dispersed by level spreaders into the adjacent landscape, which will function as treatment measures that remove sediment and pollutants before returning runoff to the natural drainage pattern, consistent with BASMAA requirements. In the event the roadways are impacting an ephemeral stream, the same treatment methodologies will be implemented in order to provide runoff quality mitigation before that runoff is returned to the Waters of the State.

See **Table 1** for acreage of proposed roads per watershed.

Residential Villa Parcels

The proposed development includes 400 residential villa parcels and 141 resort residential parcels dispersed in clusters throughout the development. These parcels will each include a single family house with a driveway and exterior hardscape with an estimated 0.5-1.0 acres of impermeable area per parcel. Since the residential parcels represent a relatively small and non-contiguous portion of the project development and associated increase in runoff, each parcel will address stormwater mitigation within the parcel boundary through a range of strategies chosen to best fit the proposed residential design and site size, topography, and landscape design . Compliance with mitigation requirements will be demonstrated in the civil site construction documents and will be unique and integral to the layout of each residential site and proposed architectural and landscape design. The majority of residential parcels include significant undeveloped areas with ample opportunity to include stormwater management strategies, including:

- Green/living roofs
- Rainwater harvesting
- Rain Gardens and/or Flow-thru Planters
- Pervious hardscape materials that infiltrate runoff
- Landscape areas that serve as water quality mitigation for hardscape runoff
- Use of existing undisturbed landscape to treat hardscape runoff
- Disperal of treated runoff to existing drainage pattern via sheet flow

For more densely developed residential parcels adjacent to commercial zones, projects will achieve stormwater compliance through use of multiple strategies including:

- Green/living roofs
- Rainwater harvesting
- Pervious hardscape materials that infiltrate runoff
- Landscape areas that serve as water quality mitigation for hardscape runoff
- Use of existing undisturbed landscape to treat hardscape runoff
- Disperal of treated runoff to existing drainage pattern via sheet flow

These approaches are in conformance with the BASMAA guidelines for mitigation of water quality and are consistent with the intended development of the MAHA properties. Conformance with stormwater regulations will be demonstrated with the building and site permit application materials submitted for each residential parcel at the time of development. **Figure 1** displays the locations of the commercial areas which have a larger percentage of hardscape and more intensive stormwater management facilities to provide through treatment.

Commercial Areas

The project includes 14 proposed commercial zones. These zones are relatively densely developed and will contain a higher percentage of hardscape then the rest of the proposed site development. As such, these sites will use a combination of self-retaining landscape features and bio-retention areas to address stormwater runoff and comply with the post-construction requirements. Each of the commercial areas has multiple DMAs associated with it, which are cataloged in **Table 2** at the end of this report. A figure illustrating the layout of hardscape within commercial areas and conceptual locations of mitigation

strategies can be found in **Appendix A – Commercial Area Drainage Management Areas**. Location, size, and type of mitigation strategies shown are conceptual and will be refined during the detailed design process.

SUMMARY

Construction occurring within these watersheds within the proposed MAHA Development have total areas of approximately 11,200 acres. Throughout this 11,200 acreas there are approximately 80 acres of impervious commercial area, 151 acres of roads, and 263 acres estimated residential impervious area. The commercial areas and residential areas will utilize a range of stormwater conveyances and treatments to provide stormwater mitigation, and if necessary, hydraulic modification. Since the roadways have impervious area equl to approximately 1.5% of the area it encompasses, they will be treated as self treating area and will us the undisturbed adjacent landscape for treatment where feasible. Where necessary, constructed BMPs will be installed to meet or exceed mitigation requirements.

Because all runoff from the proposed development is routed through a self-retaining area, a bio-retention area, or a self treating area, there should be no net increase of stormwater leaving the site for the 2-year 24-hour storm, meeting the hydromodification requirements set by the regionally accepted BASMAA guidelines in compliance with Phase II MS4 permits.

Notes:
1. In accordance with BASMAA, limit ratio of impervious to pervious area to be 2:1 maximum for self-retaining treatment system areas.
2. In accordance with BASMAA, surface area of bioretention must be a minimum 4% of the tributary impervious area.
3. Natural drainage pattern for pervious portions of site is best maintained, thus flowing into a specific watershed outlet.

Table 2 - Commercial Area Summary

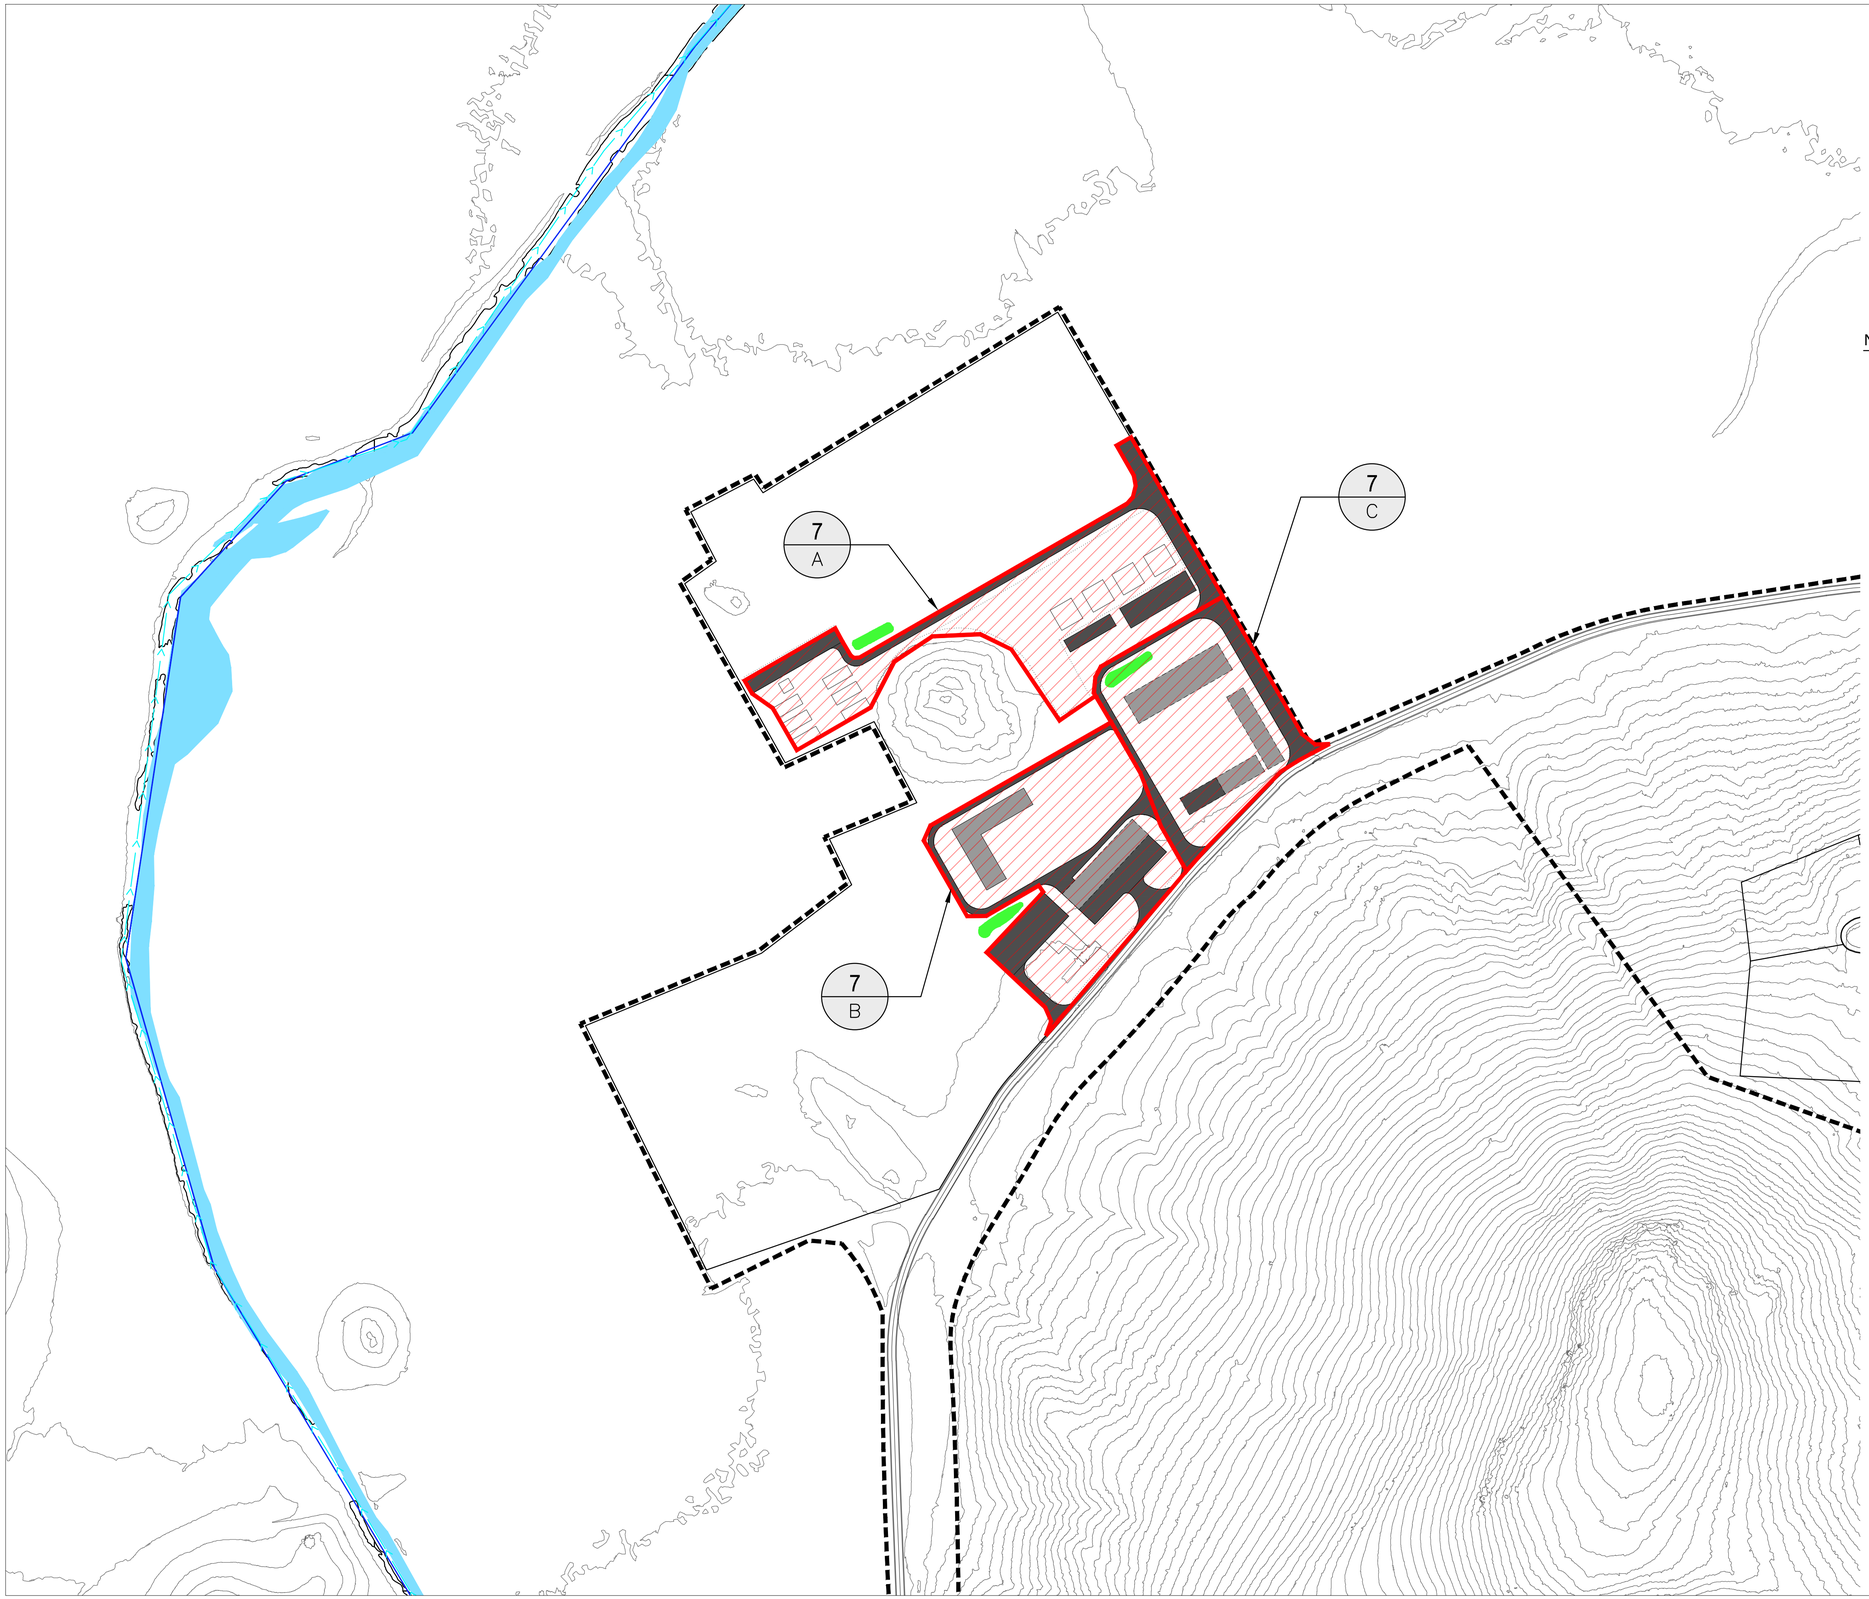
Commercial Area Drainage Management Areas



LEGEND

- DMA BOUNDARY
- WATERSHED BOUNDARY
- DMA COMMERCIAL SITE
- FLOW DIRECTION
- IMPERVIOUS - ROOF
- IMPERVIOUS - HARDSCAPE
- BIORETENTION
- SELF-RETAINING AREA

NOTES

1. IN ACCORDANCE WITH BASMAA, SURFACE AREAS OF BIORETENTION ARE TO BE A MINIMUM 4% OF THE TRIBUTARY IMPERVIOUS AREA.
2. IN ACCORDANCE WITH BASMAA, LIMIT RATIO OF IMPERVIOUS TO PERVIOUS AREA ARE TO BE 2:1 MAXIMUM.
3. ROADS ARE CONSIDERED SELF-TREATING DUE TO THE MINIMAL AREA OF NEW IMPERVIOUS IN THE POST-DEVELOPMENT CONDITION WITHIN THE OVERALL WATERSHED. ALTERNATIVE TREATMENT METHODS WILL STILL BE IMPLEMENTED AS STATED IN THE STORMWATER MANAGEMENT REPORT.
4. INDIVIDUAL RESIDENTIAL VILLA PARCELS ARE NOT INCLUDED IN THIS ANALYSIS SINCE THEY WILL EACH BE REQUIRED TO PROVIDE FULL TREATMENT AND DETENTION MEASURES IN COMPLIANCE WITH BASMAA REGULATIONS. SEPARATE STORMWATER MANAGEMENT PLANS WILL BE REQUIRED UPON SUBMITTAL OF BUILDING PERMIT FOR EACH PARCEL.

Maha Resort at Guenoc Valley

Lake County

TRANSPORTATION IMPACT ANALYSIS

1) INTRODUCTION

This traffic impact study describes the existing and future conditions for transportation with and without the proposed project. The Guenoc Valley Mixed-Use Planned Development Project (Proposed Project) consists of the development of a master planned mixed-use resort and residential community within the 16,000-acre Guenoc Valley Ranch property in southeast Lake County. The project also includes off-site workforce co-housing located in central Middletown and associated infrastructure. This study also describes the regulatory setting; the criterion used for determining the significance of environmental impacts; and summarizes potential environmental impacts and appropriate mitigation measures. This study has been conducted in accordance with the requirements and methodologies set forth by Lake County, Napa County, Caltrans, and the applicable provisions of CEQA.

Summary of Required Mitigations and Recommended Improvement Measures - The following is a summary of the proposed mitigation measures to address the transportation impacts of the project. Based on a detailed analysis of traffic operations with and without each of the proposed mitigations, implementation of the following mitigation measures would reduce the project impacts to a *less-than-significant* level. The impacts at Intersections #20 and #21 in Napa County involve mitigations that cannot be guaranteed as the improvements would be outside the jurisdiction of Lake County. Therefore, the impacts at these two intersections (which occur under future phases only) would be considered *significant and unavoidable*.

Impact #1 Impacts to intersection operations - The project would contribute to LOS operations exceeding established standards at the following intersections:

State Route 29 at Spruce Grove Road South (Intersection #3)
State Route 29 at Hidden Valley Road (Intersection #4)
State Route 29 at Hartmann Road (Intersection #5)
State Route 29 at Butts Canyon Road (Intersection #7)
State Route 29 at Tubbs Lane (Intersection #20) – *Napa County*
State Route 128 at Tubbs Lane (Intersection #21) – *Napa County*

The addition of traffic from the proposed project would contribute to these six intersections exceeding the established LOS standards. However, without

implementation of the recommended mitigations below, the development of the proposed project would result in a potentially significant impact to the LOS and queuing at the above listed intersections. With the exception of Intersections #20 and #21 the following mitigation measures would reduce the impacts at these intersections to a less-than-significant level in all of the plus project scenarios.

Mitigation Measures

Prior to construction the project would mitigate the above-identified impacts by paying a proportionate share of the construction costs of the following improvement, subject to County approval. The intersection mitigations required for the project to meet the established LOS standards are:

MM 1 (a) *State Route 29 at Spruce Grove Road South – Installation of a three-way traffic signal with crosswalks. (Scenario 6 - Cumulative Plus Phase 1)*

MM 1 (b) *State Route 29 at Hidden Valley Road – Installation of a four-way traffic signal with crosswalks. (Scenario 6 - Cumulative Plus Phase 1)*

MM 1 (c) *State Route 29 at Hartmann Road – Expansion of the existing roundabout or installation of a three-way traffic signal. (Scenario 6 - Cumulative Plus Phase 1)*

MM 1 (d) *State Route 29 at Butts Canyon Road – Installation of a three-way traffic signal with crosswalks. (Scenario 2 - Existing Plus Phase 1)*

MM 1 (e) *State Route 29 at Tubbs Lane – Installation of a three-way traffic signal with crosswalks. (Scenario 7 - Cumulative Plus Future Phases)*

MM 1 (f) *State Route 128 at Tubbs Lane – Installation of a three-way traffic signal with crosswalks. (Scenario 7 - Cumulative Plus Future Phases)*

2) PROJECT DESCRIPTION

As noted above, the Guenoc Valley Mixed-Use Planned Development Project consists of the development of a master planned mixed-use resort and residential community within the 16,000-acre Guenoc Valley Ranch property. **Figure 1** shows the project location and the surrounding roadway network. **Figure 2** shows the proposed site plan for Phase 1.
The project also includes the development of 50 off-site workforce housing units located in central Middletown and associated infrastructure. Project components would be developed over

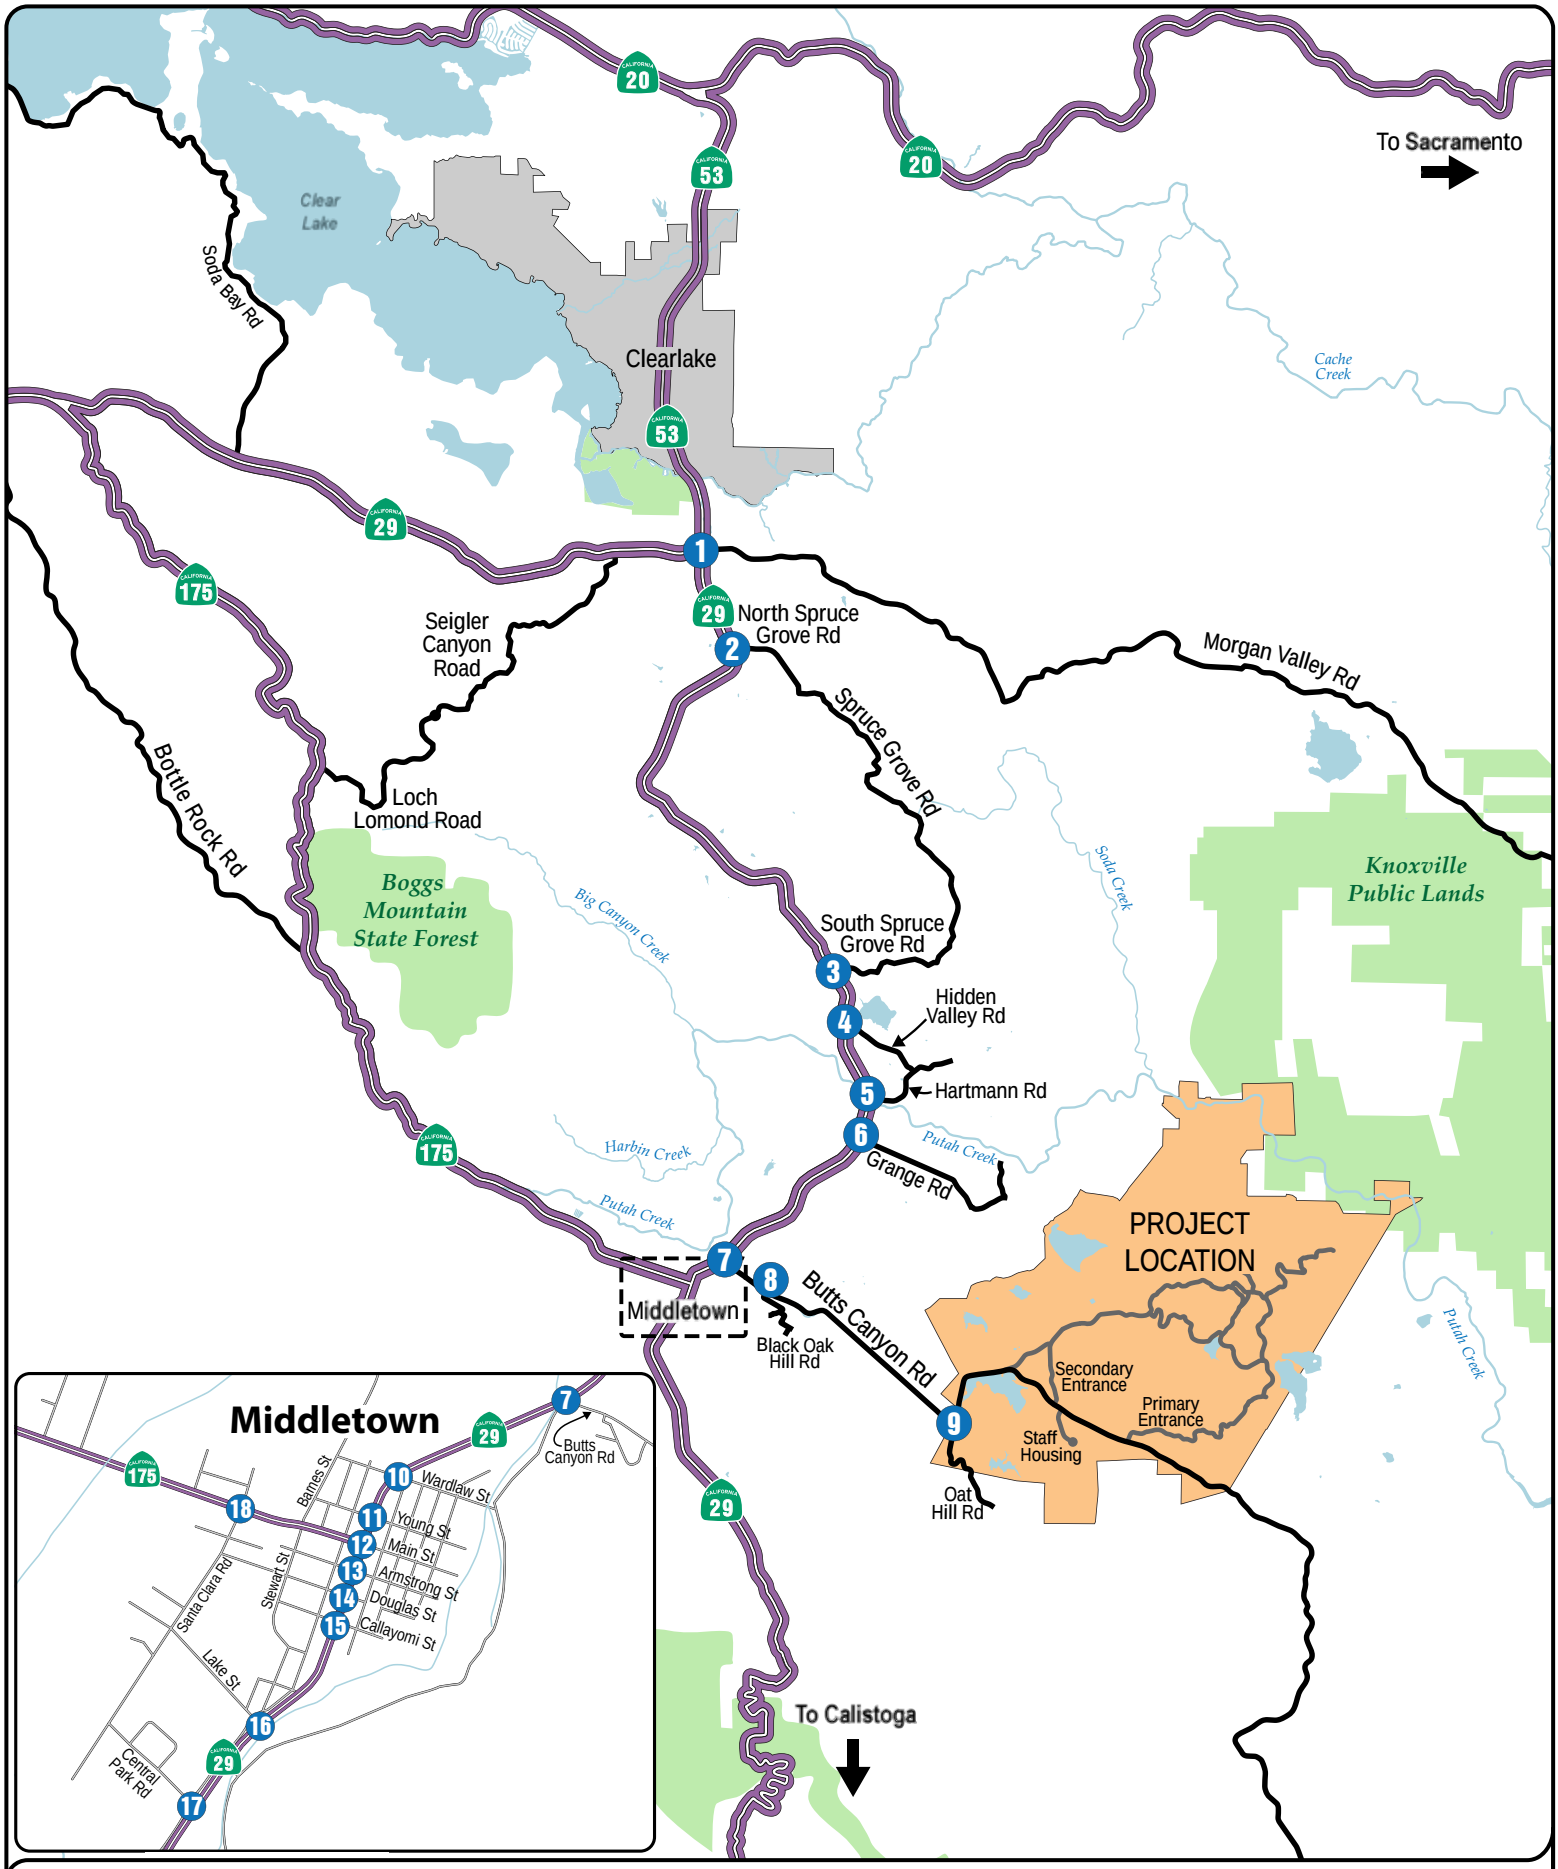

FIGURE 1 | PROJECT LOCATION & STUDY INTERSECTIONS

Abrams Associates
TRAFFIC ENGINEERING, INC.

multiple phases. The first phase (Phase 1) will be constructed in the near-term (approximately the next ten years) and future phases will be built out based on market demands. Phase 1 includes the development of a private resort within the Guenoc Valley Ranch Property consisting of: i) six boutique hotels with a combined total of i) 343 resort hotel units; ii) 411 residential estate villas; iii) up to 35 on-site workforce co-housing units; iv) resort amenities, including but not limited to outdoor entertainment area, spa and wellness amenities, sports fields, equestrian areas, a new golf course, camping area and commercial and retail facilities; v) agricultural production and support facilities; vi) essential accessory facilities, including back of house facilities, fire station and emergency response center, float plane dock, helipads; and vii) supporting infrastructure. At full buildout (Phase 1 plus the addition of future phases that could be developed under the proposed zoning district), the Proposed Project could result in the development of up to 900 hotel and resort residential units, 1400 residential villas, 300 workforce housing units, resort amenities, and accessory uses within the Project Site. For simplicity, future phases of development will be referred to as "future phases" in this document.

3) EXISTING CONDITIONS

This section of the report describes the roadways, traffic conditions and other existing transportation characteristics in the vicinity of the project. The primary basis of the analysis is the peak hour level of service for the key intersections. The hours identified as the "peak" hours are generally between 7:30 a.m. and 8:30 a.m. and 4:30 p.m. and 5:30 p.m. for the transportation facilities described, based on the intersection turning movement counts collected for this analysis. Throughout this report, these peak hours will be identified as the AM and PM peak hours, respectively.

3.1 Project Study Intersections

Based on the project's trip generation and the potential for traffic impacts a list of project study intersections was prepared in coordination with County staff. **Figure 1** shows the location of the project study intersections. Access to the site would be provided via two entrance roadways extending from Butts Canyon Road. The primary access to the Guenoc Valley Site for residents and guests would occur via a new roadway and intersection. There are two options for the primary access road. The Primary Access Road Option 1 entrance would be located approximately 2 miles south of the existing Langtry Winery Entrance. The Primary Access Road Option 2 would be located at McCain Canyon, about 2.6 miles south of the existing Langtry Winery Entrance. Secondary access would be provided through improvements to the existing intersection and roadway located a little less than a mile south of the Langtry Winery entrance. There are twenty-four additional off-site study intersections that were analyzed.

3.2 Traffic Analysis Scenarios

The study intersections were evaluated for the following seven scenarios:

- Scenario 1: *Existing Conditions* – Level of Service (LOS) based on existing peak hour volumes and existing intersection configurations.

- Scenario 2: *Existing Plus Phase 1* – Existing traffic volumes plus trips from Phase 1 of the proposed project.

- Scenario 3: *Baseline (No Project) Conditions* – The Baseline scenario is based on the existing volumes plus growth in background traffic (for three years) plus the traffic from all reasonably foreseeable developments that could substantially affect the volumes at the project study intersections.

- Scenario 4: *Baseline Plus Phase 1 Conditions* – This scenario is based on the Baseline volumes plus the trips from Phase 1 of the proposed project.

- Scenario 5: *Cumulative Conditions* – This scenario includes year 2040 cumulative volumes based on planned and approved projects, the Lake County Traffic Model, and the Napa-Solano Travel Demand Model.

- Scenario 6: *Cumulative Plus Phase 1 Conditions* – This scenario includes year 2040 cumulative volumes based on the Countywide Travel Demand Model plus the trips from Phase 1 of the proposed project.

- Scenario 7: *Cumulative Plus Future Phases* – This scenario includes year 2040 cumulative volumes based on the Countywide Travel Demand Model plus the trips from Phase 1 and planned future phases of the proposed project.

3.3 Existing Roadway Network

As discussed previously, the project location and the surrounding roadway network are illustrated in **Figure 1**. The following is a more detailed description of some of the main roadways in the area that could be affected by the project:

- **State Route 29 (SR 29)–** State Route (SR) 29 is long north-south highway between Vallejo in the south and Upper Lake in the north. Within Lake County it extends north through the community of Middletown, to the community of Lower Lake, then proceeds north-west through the community of Kelseyville and the County of Lakeport, terminating at the junction of Route 20 in the community of Upper Lake.

- **State Route 175 (SR 175)–** State Route (SR) is an east-west two-lane highway that extends west from SR 29 in Middletown. It continues west to terminate at U.S. 101 in Hopland.

- **Butts Canyon Road –** Butts Canyon Road is an east-west roadway that is designated by the Lake County General Plan as a major collector road. It extends east from SR 29 and eventually becomes Pope Valley Road in Napa County. Within the study area,

Butts Canyon Road has two travel lanes and a speed limit of 55 mph.

- **Spruce Grove Road –** Spruce Grove Road is designated by the Lake County General Plan as a major local road. It extends east from SR 29 on the north and eventually reconnects with SR 29 on the near the Hidden Valley Lake Community. Spruce Grove has two travel lanes and a speed limit of 35 mph.

- **Hidden Valley Road** – Hidden Valley Road is an east-west two-lane private roadway that serves the gated Hidden Valley Lake Community. It has two lanes and extends east from SR 29 on the north and terminates at Hartmann Road to the west.

- **Hartmann Road –** Hartmann Road is designated by the Lake County General Plan as a minor collector road. It extends east from SR 29 on the north and eventually reconnects with SR 29 on the near the Hidden Valley Lake Community. Hartmann Road has two travel lanes and a speed limit ranging from 30 to 35 mph.

- **Grange Road -** Grange Road is a two-lane east-west roadway that is designated by the Lake County General Plan as a local road. It extends east from SR 29 and terminates to the east near the project site.

3.4 Analysis Methodology

Existing operational conditions at the twenty-one (21) study intersections have been evaluated according to the requirements set forth by the Lake County General Plan. Analysis of traffic operations was conducted using the 6th Edition of the *Highway Capacity Manual* (*HCM*) Level of Service (LOS) methodology with Synchro software.[1] Level of service is an expression, in the form of a scale, of the relationship between the capacity of an intersection (or roadway segment) to accommodate the volume of traffic moving through it at any given time. The level of service scale describes traffic flow with six ratings ranging from A to F, with "A" indicating relatively free flow of traffic and "F" indicating stop-and-go traffic characterized by traffic jams. The traffic flow conditions that motorists experience rapidly deteriorate as the capacity of the intersection or roadway segment is reached. Under such conditions, there is general instability in the traffic flow, which means that relatively small incidents (e.g., momentary engine stall) can cause considerable fluctuations in speeds and delays that lead to traffic congestion. For signalized intersections, The *HCM* methodology determines the capacity of each lane group approaching the intersection. The LOS is then based on average control delay (in seconds per vehicle) for the various movements within the intersection. A combined weighted average control delay and LOS are presented for the intersection. A summary of the HCM results and copies of the detailed HCM LOS calculations are included in the appendix to this report. **Table 1** summarizes the relationship between LOS, average control delay, and the volume to capacity ratio at signalized intersections. **Table 2** summarizes the relationship between LOS and average control delay at unsignalized intersections.

[1] *6th Edition of Highway Capacity Manual*, Transportation Research Board, Washington D.C., 2016

TABLE 1
SIGNALIZED INTERSECTION LEVEL OF SERVICE DEFINITIONS

Level of Service	Description of Operations	Average Delay (sec/veh)	Volume to Capacity Ratio
A	Insignificant Delays: No approach phase is fully used and no vehicle waits longer than one red indication.	≤ 10	< 0.60
B	Minimal Delays: An occasional approach phase is fully used. Drivers begin to feel restricted.	> 10 to 20	> 0.61 to 0.70
C	Acceptable Delays: Major approach phase may become fully used. Most drivers feel somewhat restricted.	> 20 to 35	> 0.71 to 0.80
D	Tolerable Delays: Drivers may wait through no more than one red indication. Queues may develop but dissipate rapidly without excessive delays.	> 35 to 55	> 0.81 to 0.90
E	Significant Delays: Volumes approaching capacity. Vehicles may wait through several signal cycles and long vehicle queues from upstream.	> 55 to 80	> 0.91 to 1.00
F	Excessive Delays: Represents conditions at capacity, with extremely long delays. Queues may block upstream intersections.	> 80	> 1.00

SOURCES: 6th Edition of the *Highway Capacity Manual*, Transportation Research Board, 2016.

TABLE 2
UNSIGNALIZED INTERSECTION LEVEL OF SERVICE DEFINITIONS

Level of Service	Description of Operations	Average Delay (seconds/vehicle)
A	No delay for stop-controlled approaches.	0 to 10
B	Operations with minor delays.	> 10 to 15
C	Operations with moderate delays.	> 15 to 25
D	Operations with some delays.	> 25 to 35
E	Operations with high delays and long queues.	> 35 to 50
F	Operation with extreme congestion, with very high delays and long queues unacceptable to most drivers.	> 50

SOURCE: 6th Edition of the *Highway Capacity Manual*, Transportation Research Board, 2016.

For unsignalized intersections (all-way stop controlled and two-way stop controlled) the average control delay and LOS operating conditions are calculated by approach (e.g., northbound) and by movement (e.g., northbound left-turn) for those movements that are subject to delay. In general, the operating conditions for unsignalized intersections are presented for the worst approach.

3.5 Existing Intersection Capacity Conditions (Scenario 1)

The existing intersection geometry at each of the project study intersections can be seen in **Figure 3** and the existing traffic volumes at each are presented in **Figure 4.** Traffic counts at the study intersections were conducted in May of 2019 at times when local schools were in session and additional counts were also conducted in June and July of 2019 to capture summer conditions. **Table 3** summarizes the associated LOS computation results for the existing weekday AM and PM peak hour conditions. Please note that the corresponding LOS analysis calculation sheets and information regarding the peak hour factors and signal timings are presented in the appendix to this report.

As shown in **Table 3**, all of the project study intersections currently have acceptable conditions (LOS D or better) during the weekday AM and PM peak hours with the exception of Intersection #20 (State Route 29 at Tubbs Lane) and Intersection #21 (State Route 128 at Tubbs Lane) which would both exceed the LOS D threshold established in Napa County's General Plan. See Section 3.8 for a description of the applicable intersection thresholds.

3.6 Pedestrian and Bicycle Facilities

Bicycle and pedestrian facilities in the project study area are currently very limited with no bike lanes or sidewalks provided in the vicinity of the project. Bicycle paths, lanes and routes are typical examples of bicycle transportation facilities, which are defined by Caltrans as being in one of the three classes:

Class I – Provides a completely separated facility designed for the exclusive use of bicyclists and pedestrians with crossing points minimized.

Class II – Provides a restricted right-of-way designated lane for the exclusive or semi-exclusive use of bicycles with through travel by motor vehicles or pedestrians prohibited, but with vehicle parking and cross-flows by pedestrians and motorists permitted.

Class III – Provides a route designated by signs or permanent markings and shared with pedestrians and motorists.

Class II bicycle lanes have been striped in downtown Middletown on State Route 29 (Calistoga Street) from Young Street to 350 feet south of Callayomi Street. It should be noted that Butts Canyon Road is also planned to be a Class III bikeway in the Lake County Regional Bikeway Plan.

3.7 Transit Service

Bus transit service in the project area is provided by Lake Transit. Lake Transit operates local bus routes from Ukiah and Calistoga to Lake County and the Clear Lake area. The routes that run closest to the project site are Routes 2 and 3. Route 2 runs three buses per day from about 6:30 AM AM to 4:00 PM. It operates along Highway 175 from Kit's Corner to Middletown. Route 3 runs four buses per day from about 7:00 AM to 6:30 PM. It operates along State Route 29 from Clear Lake to the hospital on Deer Park Road in St. Helena. The nearest bus stop is located about six miles from the project site in Middletown.

3.8 Standards and Objectives

Existing policies, laws and regulations that apply to the proposed project are summarized below.

Caltrans - The California Department of Transportation (Caltrans) has jurisdiction over State highways. Therefore, Caltrans controls all construction, modification, and maintenance of State highways, such as SR 29. Any improvements to these roadways would require Caltrans' approval. The Guide for the Preparation of Traffic Impact Studies provides consistent guidance for Caltrans staff who review local development and land use change proposals. The Guide also

informs local agencies about the information needed for Caltrans to analyze the traffic impacts to state highway facilities.

Lake County General Plan - The Transportation and Circulation Element included in the Lake County General Plan was prepared pursuant to Section 65302(b) of the California Government Code. The Transportation and Circulation Element addresses the location and extent of existing and planned transportation routes, terminals, and other local public utilities and facilities. The General Plan identifies roadway and transit goals and policies that have been adopted to ensure that the transportation system of the County will have adequate capacity to serve planned growth. These goals and policies are intended to provide a plan and implementation measures for an integrated, multi-modal transportation system that will safely and efficiently meet the transportation needs of all economic and social segments of the County.

Significance Criteria - According to CEQA, a project would have a significant impact if it would:

- Conflict with an applicable program, plan, ordinance or policy establishing measures of effectiveness for the performance of addressing the circulation system, including transit, roadways, bicycle lanes and pedestrian facilities/paths?

  The goal of the Lake County is to maintain a Level of Service (LOS) C during the peak hours, according to the General Plan. The County does not have plans, ordinances, or policies establishing measures of effectiveness for the performance of other parts of its circulation system. Please note includes intersections under the jurisdiction of Napa County and Caltrans. The applicable measures of effectiveness are summarized below:

  Signalized Intersections - Project-related operational impacts on the signalized study intersections in the Lake County are considered significant if project-related traffic causes the Level of Service (LOS) rating to deteriorate from LOS C to LOS D, E or F. However, based on the Transportation Concept Report for State Route 29 (dated August 2013) the concept LOS for SR 29 between Calistoga and Lower Lake is LOS E. Project-related operational impacts on signalized study intersections in the Napa County are considered significant if project-related traffic causes the Level of Service (LOS) rating to deteriorate from LOS D to LOS E or F. In addition, in Napa County project impacts are also considered significant if a signalized intersection already operates at LOS E or F during one or more peak hours without project trips, and the addition of project trips increases the total entering volume by one percent or more.

  Unsignalized Intersections - Project-related operational impacts on unsignalized intersections in Lake County are considered significant if project generated traffic causes the average of all movements to deteriorate from LOS C or better to LOS D, E or F. For unsignalized intersections where the overall LOS would already exceed County standards (LOS C) it was considered a significant impact if Caltrans peak hour traffic signal warrants would be met. Project-related operational impacts on the unsignalized intersections in Napa County are considered significant if project generated traffic causes the average of all movements to deteriorate from LOS D or better to LOS E or F.

In addition, in Napa County project impacts are also considered significant if an unsignalized intersection already operates at LOS E or F during one or more peak hours without project trips and the project contributes either one percent or more of the total entering traffic for all-way stop-controlled intersections or ten percent or more of the traffic on a side-street approach for side-street stop-controlled intersections.

- Would the project conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)? This section states that vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact. Projects that decrease vehicle miles traveled in the area compared to existing conditions also have a less than significant transportation impact.
- Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections).
- Result in inadequate emergency vehicle access.

4) TRANSPORTATION IMPACT ANALYSIS

4.1 Project Trip Generation

With full buildout of the planned future phases, the Proposed Project could result in the development of up to 900 hotel rooms and resort residential units, 1400 residential villas, 300 workforce housing units, as well as resort amenities and other accessory uses within the project site. However, analysis of existing and baseline impacts is based on Phase 1 and the resulting trip generation calculations are shown in **Table 4**, using trip generation rates from the Institute of Transportation Engineer's (ITE) Trip Generation Manual, 10th Edition. The total trip generation reflects all vehicle trips that would be counted at the project driveways. Since the project has various retail, restaurants and resort amenities that would be geared towards guests, adjustments were applied to account internal trips. It was also assumed that 40% of patrons and employees would arrive via private auto due to the planned use of airport shuttles and other buses. Please note the ITE trip generation rates are based on surveys of hotels that had an average occupancy rate of 88%. Based on data from the analytics firm STR, in Napa County the average hotel occupancy rate in 2017 was 71%. For this analysis it was assumed there would be similar occupancy levels for the proposed project. Therefore, based on the forecast occupancy rates a 19% reduction was applied to the ITE trip generation results. To be conservative, the trip generation also includes traffic from the proposed on-site work force housing as well as potential traffic from the alternative off-site housing in Middletown. For the purposes of determining the worst-case impacts on the surrounding streets, the trips generated by this proposed development are estimated for the peak commute hours of 7:30 a.m. and 8:30 a.m. and 4:30 p.m. and 5:30 p.m., which represent the peak of "*adjacent street traffic*".

4.2 Project Trip Distribution

The trip distribution assumptions have been based on the project's proximity to the access routes into Lake County, the existing directional split at nearby intersections, and the overall land use patterns in the area. The trip distribution percentages assumed in this analysis are presented in **Figure 5**. **Figure 6** shows the project traffic that would be added at each of the study intersections.

4.3 Existing Plus Phase 1 Traffic Capacity Conditions (Scenario 2)

This scenario evaluates the existing conditions with the addition of traffic from the proposed project. The traffic volumes for each of the study intersections for the Existing Plus Project scenario are shown in **Figure 7**. The capacity calculations for the Existing Plus Project scenario are shown in **Table 5**. The corresponding LOS analysis calculation sheets are presented in the appendix to this report. As shown in **Table 5**, all of the project study intersections would continue to have acceptable conditions (LOS D or better) during the weekday AM and PM peak hours with the exception of Intersection #7 (State Route 29 at Butts Canyon Road), Intersection #20 (State Route 29 at Tubbs Lane), and Intersection #21 (State Route 128 at Tubbs Lane) Please note that by degrading the intersection to LOS F the project would have a significant impact at the intersection of State Route 29 and Butts Canyon Road according to County standards. However, although intersections #20 and #21 would both exceed the LOS D threshold established in Napa County's General Plan, the proposed project would not increase the side street approach by more than 10 percent at either of these intersections and therefore the project's contribution to congestion at these intersections would be *less-than-significant*.

4.4 Baseline Traffic Capacity Conditions (Scenario 3)

The Baseline scenario evaluates the existing conditions with the addition of traffic from reasonably foreseeable projects in the area and general baseline growth in traffic. For this analysis the baseline volumes were developed based on the assumption that the project completion date would be 2022 with an average traffic growth of 1% per year. The trips added by near-term development during this time were based on the forecast trip generation for a list of approved projects identified by the County and include 54 homes being constructed in the Hidden Valley community and also another 500 homes that would potentially be located to the east of SR 29, south of the Hidden Valley area. These are projects anticipated to be completed in the next five years that could potentially effect the traffic volumes at the project study intersections. The traffic volumes for each of the study intersections for the Baseline scenario are shown in **Figure 8**. **Table 6** summarizes the associated LOS computation results for the Baseline weekday AM and PM peak hour conditions. As shown in **Table 6**, all of the study intersections would continue to have acceptable conditions under the Baseline scenario during the weekday AM and PM peak hours with the exception of Intersection #20 (State Route 29 at Tubbs Lane) and Intersection #21 (State Route 128 at Tubbs Lane) which would both continue to exceed their established thresholds.

4.5 Baseline Plus Phase 1 Traffic Capacity Conditions (Scenario 4)

The Baseline plus proposed project traffic forecasts were developed by adding traffic from Phases 1 to the baseline traffic volumes. The traffic volumes for each of the study intersections for the Baseline Plus Project scenario are shown in **Figure 9**. **Table 8** summarizes the LOS results for the Baseline and Baseline Plus Project weekday AM and PM peak hour conditions. The corresponding LOS analysis calculation sheets are presented in the appendix to this report. As shown in **Table 8**, all of the study intersections would continue to have acceptable conditions under the Baseline Plus Project scenario during the weekday AM and PM peak hours with the exception of Intersection #7 (State Route 29 at Butts Canyon Road), Intersection #20 (State Route 29 at Tubbs Lane) and Intersection #21 (State Route 128 at Tubbs Lane) which would all exceed their established thresholds. The addition of project traffic at Intersection #7 would be considered a *significant impact*. Mitigations to improve the operations at these intersections are discussed in Section 5. At Intersections #20 and #21 in Napa County the proposed project would not increase the traffic on the side street approaches by more than 10 percent at either of these intersections and therefore the project's contribution to congestion at these intersections would be considered *less-than-significant*.

4.6 Cumulative Traffic Capacity Conditions (Scenario 5)

For the cumulative conditions, the intersection traffic volumes were based on the existing turning movements plus incremental growth in background traffic (0.66% per year) based on the Lake County Traffic Model and the Solano Napa County Travel Demand Model. **Figure 10** presents the cumulative build-out traffic volumes for the project study intersections. **Table 7** summarizes the LOS results for the Cumulative (Year 2040) traffic conditions at each of the project study intersections. As shown on this table, the project study intersections would continue to have acceptable conditions during the weekday AM and PM peak commute hours with the exception of Intersection #5 (State Route 29 at Hartmann Road), Intersection #20 (State Route 29 at Tubbs Lane) and Intersection #21 (State Route 128 at Tubbs Lane) which would all exceed their established thresholds.

4.7 Cumulative Plus Phase 1 Traffic Capacity Conditions (Scenario 6)

Table 7 summarizes the LOS results for the Cumulative Plus Project (Year 2040) traffic conditions at each of the project study intersection. **Figure 11** presents the cumulative build-out traffic volumes including the traffic from the proposed project. As shown on this table, all of the signalized study intersections would continue to have acceptable conditions during the weekday

AM and PM peak commute hours with the exception of Intersection #3 (State Route 29 at Spruce Grove Road South), Intersection #4 (State Route 29 at Hidden Valley Road), Intersection #5 (State Route 29 at Hartmann Road), Intersection #7 (State Route 29 at Butts Canyon Road), Intersection #20 (State Route 29 at Tubbs Lane) and Intersection #21 (State Route 128 at Tubbs Lane) which would all exceed their established thresholds. The addition of project traffic Intersections #3, #4, #5, and #7 would be considered *significant impacts*. Mitigations to improve the operations at these intersections are discussed in Section 5. At Intersections #20 and #21 in Napa County the proposed project would not increase the traffic on the side streets by more than 10 percent at either of these intersections and therefore the project's contribution at these intersections would be considered *less-than-significant*.

4.8 Cumulative Plus Future Phases Traffic Capacity Conditions (Scenario 7)

Table 9 summarizes the LOS results for the Cumulative Plus Project (Year 2040) traffic conditions at each of the project study intersection with the addition of traffic from Phase 1 and also planned future phases of the project. The resulting project trip generation with the planned future phases as well as the cumulative build-out traffic volumes including future phases of the proposed project are included in the technical appendix to this report. As shown in **Table 8**, all of the signalized study intersections would continue to have acceptable conditions during the weekday AM and PM peak commute hours with the exception of Intersection #3 (State Route

29 at Spruce Grove Road South), Intersection #4 (State Route 29 at Hidden Valley Road), Intersection #5 (State Route 29 at Hartmann Road), Intersection #7 (State Route 29 at Butts Canyon Road), Intersection #20 (State Route 29 at Tubbs Lane) and Intersection #21 (State Route 128 at Tubbs Lane) which would all exceed their established thresholds. The addition of project traffic Intersections #3, #4, #5, and #7 would be considered *significant impacts*. Mitigations to improve the operations at these intersections are discussed in Section 5. With the planned future phases the project would increase the side street approaches by more than 10 percent at Intersections #20 and #21 in Napa County which is considered a *significant impact*.

4.9 Transit Impacts

The project would not result in degradation of the level of service (or a significant increase in delay) on any roadway segments currently being utilized by bus transit in the area and, as such, no significant impacts to bus transit are expected. The proposed project not be expected to significantly impact the operating capacity any existing Lake Transit bus routes. The proposed project could potentially help support existing bus services with additional transit ridership and would not conflict with any transit plans or goals of the County or Lake Transit. Although the proposed project does have the potential to increase patronage on bus lines in the area, no significant effects on transit capacity are anticipated given that the additional ridership would be added primarily in the non-peak directions. As a result, the project would not be expected to result in any significant impacts to bus transit service in the area.

4.10 Pedestrians, Bicycles and Non-Motorized Vehicular Travel

The County does not have level of service standards for pedestrian or bicycle facilities. Nevertheless, use of existing facilities by the users of the project would not be expected to overcrowd those facilities or decrease their performance or safety. The project will add some pedestrians and bicyclists in the area but the volumes added would not be expected to significantly impact any existing facilities. In relation to the existing conditions, the proposed project would not cause substantial changes to the pedestrian or bicycle traffic in the area and would not significantly impact or require changes to the design of any existing bicycle or pedestrian facilities. However, consistent with the County and County General Plans, the project could be asked to contribute to additional pedestrian and bicycle improvement measures in the vicinity of the project.

4.11 Site Access and Circulation

No site circulation or access issues have been identified that would cause a traffic safety problem or any unusual traffic congestion or delay. Detailed LOS calculations for each of the proposed entrances under all plus project scenarios are included in the appendix. The existing intersections that would provide access to the project are forecast to continue to have acceptable operations with the existing side street stop controls. There are two options for a proposed new main primary entrance intersection: The Primary Access Road Option 1 entrance would be located approximately 2 miles south of the existing Langtry Winery Entrance. The Primary Access Road Option 2 would be located at McCain Canyon, approximately 2.6 miles south of the existing Langtry Winery Entrance.

Both options are forecast to have acceptable operations with side-street stop control. However, please note it is recommended that separate eastbound left turn pockets be provided all three resort entrances to ensure safe traffic operations. A review of the locations and designs for the proposed new main entrance intersection (under both access options) indicated the intersection would operate safely as designed with the proposed widening for the right and left-turn auxiliary lanes and the associated shoulder improvements. Both locations would meet the established sight distance standards, in part due to the proposed grading and vegetation removal adjacent to the roadway which would be associated with the planned widening for the intersection turn lanes. As an additional improvement measure for the entrance intersection under Primary Access Road Option 2 it is recommended that intersection warning signs be placed on both of the Butts Canyon Road approaches. As per the California Manual of Uniform Traffic Control Devices (CAMUTCD) the sign code for a T-intersection warning sign is W2-2. To further ensure motorists have advance warning of the new intersection, the intersection warning signs could be supplemented with the optional flashing yellow beacons, as specified in the CAMUTCD.

4.12 Parking

Parking shortages are not considered to be a significant impact under CEQA and any analysis of parking is provided for planning and informational purposes only. The proposed project would provide an adequate supply of off-street parking based on the County's requirements. The project is currently proposing to meet the County's parking requirements and subject to final County approval of the proposed parking plan there would be no significant parking impacts expected to the surrounding properties.

4.13 Vehicle Miles Traveled

One performance measure that can be used to quantify the travel from a project is vehicle miles traveled (VMT). VMT is a particularly useful metric for evaluating the impacts of growth on greenhouse gas (GHG) emissions because it can be used to estimate fuel consumption by motor vehicles. Increases in VMT cause proportional increases in greenhouse gas emissions and air pollution. This section presents the extent of the VMT-related impacts caused by the Project. The County does not currently have adopted CEQA thresholds for VMT analysis; therefore, this information is provided for informational purposes only.

One limitation of VMT measurements is they cannot be easily observed or measured and therefore must be estimated. Methods do not exist that can reliably measure the trip distances of all vehicles on a given day. VMT is typically an output from area wide travel demand models and is calculated based on the number of vehicles multiplied by the distance traveled by each vehicle. As such, the VMT estimate is dependent on the level of detail in the travel demand model. The volume of traffic and distance traveled depends on land use types, density, and location as well as the supporting transportation system, including availability of various travel modes. A travel demand model attempts to represent this relationship when forecasting vehicle trips and VMT. This analysis uses the Metropolitan Transportation Commission (MTC) Travel Model to estimate VMT per capita for the project. Neighborhoods within various jurisdictions are expressed geographically in transportation analysis zones, or TAZs. TAZs are used in transportation planning models for transportation analysis and other planning purposes.

Based on the MTC Travel Model, the Bay Area regional average daily VMT per capita is estimated to be 15.0 in the year 2020 and 13.8 in the year 2040. Because the homes built by the project would be similar to other residential developments in the area, project residents are estimated to have similar travel behavior as other residents in the TAZ closest to the project; thus, the VMT per capita estimated by the MTC Model for the TAZ closest to the project site would represent the approximate VMT per capita that would be generated by the project.

Table 9 summarizes the 2020 and 2040 VMT for TAZ 1312, the TAZ which is closest where to the project is located, and provides a comparison to regional and county wide averages. It is expected that, as shown for the TAZ, the project would have a higher VMT per capita than the the Lake County or Bay Area region averages under both 2020 and 2040 conditions because,

TABLE 9
DAILY VEHICLE MILES TRAVELED PER CAPITA

Area	*2020*	*2040*
TAZ 1312 (Project)	37.5	34.6
Lake County	31.1	30.1
Bay Area	15.0	13.8

SOURCE: MTC Model results at analytics.mtc.ca.gov/foswiki/Main/PlanBayAreaVmtPerCapita; accessed September, 2019.

as stated above, the homes built by the project would be similar to existing developments in the area. The VMT would also be higher because of the nature of the project site. For example, the project site is lacking in commercial and retail services for residents within walking distance and the project site is not located close to bus stops served by public transit. The VMT generated by the Project could be substantially reduced by implementation of the required Transportation Demand Management (TDM) program.

4.14 Transportation Demand Management Program

In September 2010, the California Air Resources Board (ARB or Board) set passenger vehicle greenhouse gas (GHG) emission reduction targets for 2020 and 2035 for each of the 18 Metropolitan Planning Organization (MPO) regions in California under the Sustainable Communities and Climate Protection Act of 2008 (SB 375). Lake County supports these goals by implementing policies that require new projects achieve a reduction in the number of peak hour drive-alone commute vehicle trips. The project transportation demand management (TDM) program requested by the County is intended to reduce the total vehicle miles traveled (VMT) by motorists in the project area. Please note that reductions in VMT are generally considered to translate directly into reduced GHG's.

Proposed TDM Strategies - The following is a summary of strategies that are recommend to be incorporated into the project:

Private Shuttle Service – There are currently no plans for Lake Transit to run buses along Butts Canyon Road near the project site and the nearest bus stops are about six miles away in Middletown. While it is possible Lake Transit might consider adding a stop on Butts Canyon Road in the future to serve project employees, it is our understanding that there is no funding available for it at this time. Alternatively, the project could potentially provide a frequent direct

weekday shuttle service specifically for employees during the peak morning and evening commute periods. This could operate between the project site any and off-site work force housing with a stop at the Lake Transit bus transfer point in Middletown. Please note shuttles would need be fully accessible to passengers using wheelchairs. It is recommended the applicant also explore providing a real-time smart-phone app that tracks arrivals to make shuttle use more reliable and convenient. Bus service for patrons of the project has been assumed as part of this analysis. The current assumption is that regular bus service to and from San Francisco and Sacramento will accommodate approximately 40% of resort patrons.

Carpool and Ride-Matching Assistance Program – The management shall offer personalized ride-matching assistance to pair employees interested in forming commute carpools. As an enhancement, management may consider using specific services such as ZimRide, TwoGo by SAP, Enterprise RideShare, or 511.org RideShare.

Preferential Parking for Carpoolers – The management shall offer preferential carpool parking for eligible commuters. To be eligible for carpool parking, the carpool shall consist of three or more people. The management shall monitor and provide adequate carpool spaces to meet or exceed potential demand.

Dedicated Parking Spaces for Car Share Services – Setting aside parking spaces to be dedicated for use by car share services to serve employees. This could reduce parking demand and GHG emissions associated with the project by providing more flexibility for employees who otherwise utilize alternate modes. The availability of car share services within a project can potentially reduce the demand for employees to own their own cars. A review of over 25 studies from Europe and the U.S. where car sharing services are available, found that in North America, on average, 20% of respondents gave up a privately owned vehicle and 40% avoided purchasing one, which results in an average of five privately owned vehicles replaced per every car sharing vehicle.[2] However, it should be noted that this data is for residential projects and the effects, while still significant, would most likely be less for a commercial project.

On Site Sales of Transit Passes – The building management shall offer direct on-site sales of transit passes purchased and sold at a bulk group rate.

TDM Coordinator – Management shall designate a "*TDM coordinator*" to coordinate, monitor and publicize TDM activities. The effectiveness of providing a TDM Coordinator on automobile ownership is not known at this time. It is assumed the applicant may instruct the management company to designate their on-site manager as the TDM coordinator.

[2] *Car Sharing: Where and How it Succeeds, TCRP Report 108*, Transportation Cooperative Research Program, Washington D.C., 2005.

Transportation and Commute Information Kiosks - An information board or kiosk will be located in a common gathering area (e.g., lobby, employee entrance, break, or lunch room). The kiosk will contain transportation information, such as Emergency Ride Home (ERH), transit schedules, bike maps, and 511 ride-matching. Information will be updated periodically by the designated Transportation Coordinator (TC).

Tenant Performance and Lease Language – TDM Requirements - For all tenants, the applicant will draft lease language or side agreements that require the identification of a designated contact responsible for compliance and implementation of the TDM program.

Tenant/Employer Commute Program Training - As needed and applicable, the applicant or property management will provide individual tenants of the project with initial TDM (and commute) program training, commute program start-up assistance. The overarching goals of this support function are to reduce commute trips for employees and assist with employee marketing and outreach.

Employee Transportation Brochure - At the time of occupancy, all employees will be provided with an Employee Transportation Brochure regarding the Commute Program. This brochure will include (but not be limited to) information about shuttle service, carpool parking, transit opportunities, ride-matching services, bicycle routes, and emergency rides home.

5) MITIGATION

The following is a list of project impacts and proposed mitigation measures to address the transportation impacts of the project. Based on a detailed analysis of traffic operations with and without each of the proposed mitigations, implementation of the following mitigation measures would reduce the project impacts to a *less-than-significant* level. Detailed LOS calculations and a summary table verifying the mitigations would reduce the impacts to a less than significant level are included in the appendix to this report. The impacts at Intersections #20 and #21 in Napa County involve mitigations that cannot be guaranteed as the improvements would be outside the jurisdiction of Lake County. Therefore, the impacts at these two intersections (which occur under future phases only) would be considered *significant and unavoidable*.

Impact #1 Impacts to intersection operations - The project would contribute to LOS operations exceeding the established standards at the following six intersections:

State Route 29 at Spruce Grove Road South (Intersection #3)
State Route 29 at Hidden Valley Road (Intersection #4)
State Route 29 at Hartmann Road (Intersection #5)
State Route 29 at Butts Canyon Road (Intersection #7)
State Route 29 at Tubbs Lane (Intersection #20) – *Napa County*
State Route 128 at Tubbs Lane (Intersection #21) – *Napa County*

The addition of traffic from the proposed project would contribute to these six intersections exceeding the established LOS standards. However, without implementation of the recommended mitigations below, the development of the proposed project would result in a potentially significant impact to the LOS and queuing at the above listed intersections. With the exception of Intersections #20 and #21 the following mitigation measures would reduce the impacts at these intersections to a less-than-significant level in all of the plus project scenarios.

Mitigation Measures

Prior to construction the project would mitigate the above-identified impacts by paying a proportionate share of the construction costs of the following improvement, subject to County approval. The intersection mitigations required for the project to meet the established LOS standards are:

MM 1 (a) State Route 29 at Spruce Grove Road South – Installation of a three-way traffic signal with crosswalks. (Scenario 6 - Cumulative Plus Phase 1)

MM 1 (b) *State Route 29 at Hidden Valley Road – Installation of a four-way traffic signal with crosswalks.*
(Scenario 6 - Cumulative Plus Phase 1)

MM 1 (c) *State Route 29 at Hartmann Road – Expansion of the existing roundabout or installation of a three-way traffic signal.*
(Scenario 6 - Cumulative Plus Phase 1)

MM 1 (d) *State Route 29 at Butts Canyon Road – Installation of a three-way traffic signal with crosswalks.*
(Scenario 2 - Existing Plus Phase 1)

MM 1 (e) *State Route 29 at Tubbs Lane – Installation of a three-way traffic signal with crosswalks.*
(Scenario 7 - Cumulative Plus Future Phases)

MM 1 (f) *State Route 128 at Tubbs Lane – Installation of a three-way traffic signal with crosswalks.*
(Scenario 7 - Cumulative Plus Future Phases)

Impact #2 Impacts related to conflicts with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or potential decreases to the performance or safety of such facilities.

The project would not result in degradation of the level of service (or a significant increase in delay) on any roadway segments currently being utilized by bus transit in the area and would not increase ridership beyond existing capacity. As such, no significant impacts to bus transit are expected. In addition, the project would not significantly impact or change the design of any existing transportation facility or create any new safety problems in the area. Therefore, based on the County's significance criteria the project's impacts on alternative transportation would be considered less than significant and no mitigations would be required.

Mitigation Measure(s)
None required.

Impact #3 Demolition and construction activities associated with the proposed project would result in an increase in traffic to and from the site and could lead to unsafe conditions near the project site.

The increase in traffic as a result of demolition and construction activities associated with the proposed project has been quantified assuming a worst-case single phase construction period of 36 months.

Heavy Equipment

Approximately twenty pieces of heavy equipment are estimated to be transported on and off the site each month throughout the demolition and construction of the proposed project. Heavy equipment transport to and from the site could cause traffic impacts in the vicinity of the project site during construction. However, each load would be required to obtain all necessary permits, which would include conditions. Prior to issuance of grading and building permits, the project applicant would be required to submit a Traffic Control Plan.

The requirements within the Traffic Control Plan include, but are not limited to, the following: truck drivers would be notified of and required to use the most direct routes , as determined by the County Engineering Department; all site ingress and egress would occur only at the main driveways to the project site and construction activities may require installation of temporary (or ultimate) traffic signals as determined by the County Engineer; specifically designated travel routes for large vehicles would be monitored and controlled by flaggers for large construction vehicle ingress and egress; warning signs indicating frequent truck entry and exit would be posted on Butts Canyon Road; and any debris and mud on nearby streets caused by trucks would be monitored daily and may require instituting a street cleaning program. In addition, the ten loads of heavy equipment being hauled to and from the site each month would be short-term and temporary.

Employees

The weekday work is expected to begin around 7:00 AM and end around 4:00 PM. The construction worker arrival peak would occur between 6:30 AM and 7:30 AM, and the departure peak would occur between 4:00 PM and 5:00 PM. These peak hours are slightly before the countywide commute peaks. It should be noted that the number of trips generated during construction would not only be temporary, but would also be substantially less than the proposed project at buildout. Based on past construction of similar projects, construction workers could require parking for up to 250 vehicles during the peak construction period. Additionally, deliveries, visits, and other activities may generate peak non-worker parking demand of 20 to 25 trucks and automobiles per day. Therefore, up to 275 vehicle parking spaces may be required during the peak construction period for the construction employees. Furthermore, the Traffic Control Plan requires construction employee parking be provided on the project site to eliminate conflicts with nearby residential areas. Because the construction of the project can be staggered so that employee parking demand is met by using on-site parking, the impacts of construction-related employee traffic and parking are considered less-than-significant.

Construction Material Import/Export

The project would also require removal of existing debris as well as the importation of construction material, including raw materials for the building pads, the buildings, the parking area, and landscaping. During the maximum peak construction period, it is estimated material import and export could generate approximately 150 truck trips per day. Furthermore, under the provisions of the Traffic Control Plan, if importation and exportation of material becomes a traffic nuisance, then the County Engineer may limit the hours the activities can take place.

Traffic Control Plan

The Traffic Control Plan would indicate how parking for construction workers would be provided during construction and ensure a safe flow of traffic in the project area during construction. This analysis assumed construction of the entire project in one phase to identify the potential worst-case traffic effects. If the project is built in phases over time, the effects of each phase will be the same or less. Each phase will be subject to a Traffic Control Plan and oversight by the County Engineer. The last phase may require added worker parking measures, depending on the circumstances, as there will not be any remaining vacant land for parking. Therefore, the demolition and construction activities associated with the proposed project or its individual phases would not lead to noticeable congestion in the vicinity of the site or the perception of decreased traffic safety resulting in a ***less-than-significant*** impact.

Mitigation Measure(s)
None required.

Impact #4 Impacts related to site access and circulation.

The proposed project would have its main entrance Butts Canyon Road. Two secondary access points will also be provided. The secondary entrance would be located to the west of the main entrance. As discussed above, the proposed mitigation for the project's potential safety impacts at the main access intersection and the secondary entrances is the installation of separate left turn pockets. Based on a review of the proposed site plan it was determined that the site circulation should function well and would not cause any safety or operational problems. The project site design has been required to conform to County design standards and is not expected to create any significant impacts to pedestrians, bicyclists or traffic operations. Therefore, impacts related to site access and circulation to the proposed project would be ***less-than-significant*** with implementation of the following mitigation measure.

Mitigation Measure

MM 1 (a) Butts Canyon Road at the Three Project Entrances – Installation of 250-foot-long left turn pockets at all three project entrances.

Impact #5 Impacts regarding emergency vehicle access on and surrounding the proposed project site.

Sufficient emergency access is determined by factors such as number of access points, roadway width, and proximity to fire stations. The land use plan for the proposed project would include three entrances on Butts Canyon Road. All lane widths within the project would meet the minimum width that can accommodate an emergency vehicle; therefore, the width of the internal roadways would be adequate. In addition, with the proposed mitigations the addition of traffic from project traffic would not result in any significant changes to emergency vehicle response times in the area. Therefore, development of the project is expected to have ***less-than-significant*** impacts regarding emergency vehicle access.

Mitigation Measure(s)
None required.

Technical Memorandum

To: Kirsty Shelton
Chris Meredith

From: Peter Haase, MS, PE

Date: Revised October 4, 2019

Subject: **Water Demand Analysis for Maha Resort at Guenoc**

Dear Kirsty and Chris:

Sherwood Design Engineers, Inc. (SDE) has prepared a revised water demand analysis for the First Phase (Phase I) and Future Phase of development planned for the Maha Resort at Guenoc, in Lake County, California (The Project). The water demand analysis presents The Project water demands for the Phase I and future phased projects as described in the Specific Plan of Development (SPOD) submitted to the County of Lake July 1, 2019. The technical memorandum describes the methodology and the results of the water demand analysis.

1. Project Description

The Project has applied to the County of Lake for a development application. Pursuant to the California Environmental Quality Act (CEQA) the application will include an Environmental Impact Report (EIR). The EIR will include a programmatic analysis of the impacts to rezone the 16,000-acre Guenoc Ranch to "Guenoc Valley District (GVD)". In addition to the programmatic level EIR to allow the rezone, the EIR will include a detailed, project level analysis of the impacts at a Project level review of the first phase (Phase I) of development, submitted as the SPOD.

The Programmatic review of the overall project will occur in the EIR to assess the environmental impacts of the rezone. Project level review will analyze the specific objectives and environmental impacts of the proposed first phase of development, as outlined in the SPOD. The Project Level review EIR will analyze the environmental changes caused by a development including the construction and operation, whereas the programmatic EIR will look at the impacts of the rezone classification rather than a project specific analysis. Future phases of the project will require additional CEQA review.

As referenced in SPOD, Phase I includes the construction of the roads and the utility infrastructure, approximately 225 hotel rooms, 144 resort residential units, and 411 Residential villas, workforce and staff housing, and the accessory to resort commercial structures. This report looks at the feasibility of these operations relating to the phase one development. (The actual number of hotel rooms has been reduced for the Phase I project; however, for this analysis the original room numbers presented in the SPOD have been used, which results in a more conservative estimate of water demand).

Future phase development will include additional hotel rooms, resort residential units, residential villas, expanded sport facilities and recreation opportunities.

2. Water Demand Analysis

The Project will rely on both potable and non-potable water demands to supply the various water uses at the site. The Project will be designed with two separate water systems: a potable water system primarily used to supply all the drinking, interior, and recreation water demands features (i.e. swimming pools) for The Project and a separate non-potable water system will be installed to meet all the non-drinking water and primarily exterior water demands for irrigation, non-recreational water features (i.e. fountains and other non-recreational features), fire protection water and construction related water demands.

Potable water demand will be met by onsite water supply wells that have been or will be constructed to meet the State's standards for drinking water supply. Non-potable water demand will be met by a combination of existing surface water entitlements stored in the existing onsite reservoirs for areas that are located on Place of Use (POU) land, on-site recycled wastewater, and from groundwater supply wells. All POU land has an existing appropriative permit water right so that surface water can been used for a beneficial purpose, such as irrigation on that delineated land.

The following sections include a description of the methodology used to calculate the water demands for the project and results of the water demand calculations.

2.1. Potable Water Demand

Onsite deep groundwater supply wells will be used to supply potable water to the project.

SDE calculated the potable or domestic water demands for the project. The potable water demands include the following:

- Domestic and commercial water needs for drinking, cooking, bathing, toilet flushing, and laundry.
- Clean-in-place (wash) water for wineries and other food related production facilities.

SDE employed water use values published in technical references for similar types of uses and the expected occupancy rates.[1,2] SDE used two different occupancy rates for the hospitality and residential uses: the first occupancy rate represents the average occupancy rate for similar resorts managed by the development team, which run at 60% for the hotel rooms and resort villas, and 40% for the estate villas, and the second occupancy rate assumes the resort and villas are at full occupancy (100%). Similarly, many of the support facilities are not expected to run at full occupancy, which is also accounted for the in the water demand calculations.

Commercial Retail Space. Water demand values for commercial uses are calculated based on values published based on the area or square footage of retail and commercial space, a method relied on by many jurisdictions in California.[3]

Makeup Water for Pools and Recreational Water Features. Water demand calculations for pools and man-made recreational water features have been estimated using pan evaporative data reported for Markley Cove in Lake Berryessa by the CA Department of Water Resources. The annual average pan evaporation rate at Lake Berryessa was calculated to be 53 inches

[3] San Francisco Public Utility Commission, *Water Use Calculator*

per year for the period from 1991 to 2018.

Winery Process Water Demands. Water demand calculations for the winery production is based on the amount of water used per case of wine produced at the winery. SDE used 16 gallons of water required to produce a case or 2.4 gallons of wine.[4]

Table 1 presents the values relied upon to calculate the potable water demands for both Phase I and Future Phase potable water demands. Tables 2 and 3 presents the estimated daily water demands under average and maximum occupancy rates for both the Phase I and Future Phase projects, respectively. Tables 4 and 5 presents the estimated annual average potable water demand for Phase I and Future Phase projects, respectively. Table 5 presents the potable water demand for the Future Phase development. Table 6 presents a summary the total daily and annual potable water demands for both the Phase I and Future Phase projects.

Table 1. Unit Water Demands Values

Description	Unit	Unit Demand	Reference Number
Restaurant			
Staff	gpd	15	1,2
Guest	gpd	10	1,2
Pool

2.2. Non-Potable Water Demand

The non-potable water demands include the landscape irrigation demands for the commercial and residential properties, new vineyard and farm areas, recreational areas including the Renaissance Golf Course and the Equestrian Center, roadway landscaping and greenroofs. Additional non-potable water demands include make up water for non-recreational water features (fountains and reflection pools). Non-potable water will also be used as the primary source for fire protection; however, the fire water demand will occur sporadically is not considered to be continuous, and as such, is not factored into the average demand analysis. There are three sources of non-potable water: recycled water, existing entitled surface water rights (appropriative and riparian) and groundwater. Although recycled and entitled water will be conveyed together to the end use, they will be stored separate. Recycled water will be stored in tanks whereas entitled water will continued to be stored in the existing reservoirs.

Irrigation Demand. The irrigation water demand estimates for the project have been calculated based on the water budget procedures established by the CA Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO) (CCR, Title 23 Waters, Division 2. Department of Water Resources, Chapter 2.7). The Estimated Total Water Use (ETWU) for each irrigation month was calculated using the ETWU formula in the MWELO. This formula was employed to calculate the water demand for all irrigated areas associated with the project including ornamental, recreational (golf course and equestrian fields/arenas) and new vineyard and farm areas. Actual water meter readings were not employed in this analysis.

Non-Recreational Water Features. There are water features (small ornamental ponds and engineered waterfalls incorporated at the Equestrian Center and Maha Farms as part of the Phase I development. At the Equestrian Center an 8-acre storage pond and constructed wetlands for habitat restoration is planned for this area. Non- potable will be used as the primary source of makeup water to replenish water losses from the pond and wetland system primarily as a result of evaporation. Monthly pan evaporation rates have been used to estimate the amount of makeup water that will be required to maintain these water features.

The Phase I project will include 452 acres of irrigated acres and 230 acres of this land is located in the Place of Use areas that can use surface water to meet the irrigation demands. The remaining 222 acres will be supplied by both recycled water and groundwater resources.

A variety of landscaping type are included in the The Project, including the golf course, the equestrian area, and other landscaped areas that will consist predominantly California native drought tolerant plantings, ornamental plantings, additional vineyards, farms and gardens and other landscape types. Based on the irrigation water demands prepared by SWA Landscape Architects the overall water demand for landscape irrigation is estimated to be 319.68 acre-feet per year or 1.44 acre-feet per acre for lands outside of the POU.

Tables 7 and 8 present estimated non-potable water demands for Phase I and Future Phase project areas to satisfy irrigation and evaporative make up water. The results present the average annual demand for both lands that will receive Place-Of-Use (POU) surface water demands, and land that is not in Place-Of-Use areas (Non-POU) and will rely on both recycled and groundwater to meet the non-potable demands. The results are presented in acre-feet per year.

The estimates indicate that the Phase I net water demand will be 482 ac-ft/yr. [5] and the total non-potable water demand is estimated to be 1,027 ac-ft/yr. The estimates indicate that the Future Phase net water demand for Non-POU irrigation water will be 759 ac-ft/yr, and the total water demand is estimated to be 1,947 ac-ft/yr. The POU water demands will be met under the established appropriative rights.

The total annual net water demands supplied by recycled water and groundwater, for both phases of projects, are presented in Table 9. It is assumed that approximately 65% of the potable water will be available as recycled water for both Phase I and Future Phase Projects and the remaining Non-POU irrigation water demands lands will be supplied by groundwater. Based on these calculations for the Phase I project approximate 47% of the non-POU land can be irrigated by reclaimed water and the balance will be supplied by groundwater. For the Future Phase project approximately 27% of the non-POU land irrigation demand is estimated to be supplied by recycled water and the balance will be supplied by groundwater.

[5] Note, the Project will rely on the existing water rights to continue to irrigate lands within the POU areas, approximately 545 ac-ft/yr for Phase 1 and approximately 1,187 ac-ft/yr for the Future Phase.

Table 7. Phase I Annual Non-Potable Water Demand Estimates (in Acre-Feet Per Year)

Total Net New Water Demand							**759.2**

[6] Note: Future phases will be evaluated under a separate CEQA project level review process and document.

Table 9. Summary of Non-Potable Net Water Demands by Sources for Phase I and Future Phase Projects

Phase	Recycled Water (ac-ft/yr)	Groundwater (ac-ft/yr)	Total Water Demand (ac-ft/yr)
Phase 1	154	328	**482**
Future Phase	162	597	**759**
Total Demand by Source (ac-ft/yr)	**316**	**926**	**1,242**

Fire Water Storage Requirements and Sources

Fire water demand for the site will be supplied by non-potable water sources including surface water from the surface water storage reservoirs, recycled wastewater and from non-potable irrigation groundwater wells. All of these sources of water will be connected to a common non-potable water distribution system, designated with the state mandated purple piping. The non-potable water distribution system will be sized to supply the fire water flows to water hydrants, to both internal and external fire sprinkler systems, to landscape and recreational area landscape areas and, non-recreational water features.

Fire water storage requirements have been calculated for each development cluster in order to determine the amount of water that will be maintained in each area; however, fire water demands have not been calculated as a water demand that must be met on a continuous basis. It is important to note that the existing surface water reservoirs maintained on the property will serve as a primary source of fire water for project. In some parts of the property the availability of surface water is limited, and in these areas standalone water storage facilities will be required.

The water storage requirements have been developed comparing both Lake County Fire Protection Standards (LCFPS) that apply to residential properties and the California Fire Code (CFC) that applies to the commercial uses on the site.

LCFPS requires that each residential lot has a minimum volume of water that must be available daily, equivalent to 350 gallons per residence.

The CFC minimum fire flow requirement for sprinklered buildings is 180,000 gallons of water to provide a fire flow of 1,500 gallons per minute for two (2) hours.

Using the Lake County requirements, SDE calculated the maximum fire water storage for the largest residential development cluster, Maha Farms, which will have 211 residential units at full build out. Based on this number of units the minimum fire water storage volume would be 73,850 gallons. Given the mixed use and commercial development planned in this area, 180,000 gallons of fire water will be required for this area. Based on this comparison it is safe to assume that for all of the mixed used clusters (commercial and residential developments 180,000 gallons of stored fire water will be required.

Table 10. presents the minimum volume of water required for the different areas on the property and the proposed source of fire water supply for the Phase I project. The Future Phase will be evaluated at the project level EIR for the specific project.

Table 10. Fire Water Volume and Source

	Description	Residential Units	Residential Fire Storage	Commercial Storage	Proposed Water Source

Date: October 14, 2019

Subject: **Water and Wastewater Supply Facilities for Maha Resort at Guenoc**

Dear Kirsty, Chris, and Kevin:

Sherwood Design Engineers, Inc. (SDE) has prepared a water supply facilities memorandum to provide a description of the proposed water supply facilities for the First Phase (Phase I) of the Maha Resort at Guenoc, in Lake County, California (The Project).

1. Project Description

The Project has applied to the County of Lake for a development application. Pursuant to the California Environmental Quality Act (CEQA) the application will include an Environmental Impact Report (EIR). The EIR will include a programmatic analysis of the impacts to rezone the 16,000-acre Guenoc Ranch to "Guenoc Valley District (GVD)". In addition to the programmatic level EIR to allow the rezone, the EIR will include a detailed, project level analysis of the impacts at a Project level review of the first phase (Phase I) of development, submitted as the Specific Plan of Development (SPOD).

The Programmatic review of the overall project will occur in the EIR to assess the environmental impacts of the entire project proposal. Project level review will analyze the specific objectives and environmental impacts of the proposed first phase of development, as outlined in the SPOD. The Project Level review EIR will analyze the environmental changes caused by a development including the construction and operation, whereas the programmatic EIR will look at the impacts of the rezone classification rather than a project specific analysis. Future phases of the project will require additional CEQA review.

Phase I includes the construction of the roads and the utility infrastructure, approximately 255 hotel rooms, 144 resort residential units, and 411 Residential villas, workforce and staff housing, and the accessory to resort commercial structures[1]. This report looks at the feasibility of these operations relating to the phase one development.

Future phase development will include additional hotel rooms, resort residential units, residential villas, and expanded sport and recreation opportunities.

The Project will include both potable and non-potable water demands to supply the various water uses at the site. The Project will be designed with two separate water

[1] Since the publication of this study, the total units have been updated to be less than the number indicated here based on the tentative map lot analysis; therefore, the total analysis is conservative.

systems: a potable water system primarily used to supply all the drinking, interior, and recreation water demands features (i.e. swimming pools) for The Project and a separate non-potable water system will be installed to meet all the non-drinking water and primarily exterior water demands for irrigation, non-recreational water features (i.e. fountains and other features), fire protection water and construction related water demands.

Potable water demand will be met by onsite water supply wells that have been or will be constructed to meet the State's standards for drinking water supply. Non-potable water demand will be met by a combination of surface water from the onsite reservoirs for areas that are located on Place of Use (POU) land. On-site recycled wastewater, and groundwater supply wells will supply water to lands located outside of the designated POU land. POU land is has an appropriative permit water right so that surface water can been used for a beneficial purpose, such as irrigation of agricultural on that delineated land.

Planned Water Supply Facilities

New water supply infrastructure is being planned for the Maha Resort that will include both a potable and non-potable water systems. The following sections provide a general description of these different water systems.

7.1. Potable Water System Improvements

The potable water system will include two main water systems that will serve the Guenoc Valley area and the Upper Bohn Lake area. The Guenoc Valley system will be designed to serve the Central Back of House area, the Equestrian Center, and the Bohn Ridge Resort. The Upper Bohn Lake system will serve the Maha Farm/Sales Center area, the Spa, Emergency Center and Support Services, the Red Hill Estates and Renaissance Golf Course, and the Resort at Trout Flat. A small water system will serve the remotely located Camping Area.

Each water system will include a series of deep, water supply wells that will pump water into the potable water distribution system. The distribution system will include a pressure piped network of main and submain lines to convey potable water to the commercial and residential parcels. The water distribution system that will consist of a series of branched and looped water lines and will be constructed with either PVC or HDPE pipe rated for drinking water. The potable water system will include strategically placed water storage tanks and booster pump station stations to maintain pressure in the system to meet maximum water demands.

Water Supply Wells. Based on the results of the ongoing hydrogeologic investigation it is apparent that each main water system will consist of water supply wells that are placed in areas of abundant groundwater yields. Each water system is being planned to have between two to four wells, and each well will likely be drilled to 300 to 500 feet deep and completed with at least a 50-foot sanitary seal. Each well will be designed to produce between 75 to 300 gallons per minute depending on the results of the pump test results.

The Back of House area will also be served by the existing spring. The spring reportedly provided approximately 10 gallons per minute and will be used for domestic water supply only.

At the Cross Roads area on the Upper Bohn Ridge zone there is a non-potable well (Cross Roads Well) that yields close to 300 gallons per minute. This well will be used for irrigation and other non-potable uses at the site.

Figure 1 shows the proposed and approximate locations of the water supply wells and spring for the Phase I project.

Each water system will have multiple wells (at least two) so that at any given time only one or two wells will be in operation, and one or two additional wells can be placed in standby and "rested" for several months. This will allow the system operator to manage wells in a manner so that they are not over pumping and over drafting the groundwater basin.

The placement of the wells will be done in a manner to avoid direct impacts to sensitive cultural, historic and biotic resources at the site.

Water Storage Tanks. A series of potable water storage tanks will be installed at each water system. The potable water storage tanks will be steel bolted above ground tanks placed in locations that are not visible to the commercial and residential parcels. The domestic water storage tanks will be sized to satisfy the maximum day demand requirements for each area.

For the Guenoc Valley water system the total amount of water storage is estimated to be approximately 181,000 gallons. A preliminary analysis indicates that three tanks would service this area. A 130,000 gallon tank would serve the Equestrian Center and the Central Back of House area. A 40,000 gallon tank would serve Bohn Ridge and a 11,000 gallon tank would serve the Spa.

For the Upper Bohn Lake water system, a total of approximately 270,000 gallons of potable water will be needed. For this system approximately 130,000 gallons will be needed at Maha Farms area, a 105,000 gallons to serve the Red Hill Estate, the golf course, the Emergency Center and short-term staff accommodations, and 35,000 to serve the Resort at Trout Flat.

Additional smaller tanks will be needed to serve remote areas. A 14,000 gallon tank will be needed at the onsite workforce housing area, a 9,000 gallon tank will be needed at the Wilderness Camp area, and a 5,000 gallon tank will be needed at the Aerial Access area.

The water storage tanks will likely be placed in elevated locations to provide gravity flow to the parcels served in the event of a power outage. The tanks will likely be placed on graded pads that will also be bermed with the cut material so that the grading cut and fill volumes are closely balanced to avoid the transport of soils from these sites. The location of the tank sites can be selected and planned so that their installation and operation does not impact sensitive cultural, historic, and biotic resources at the site.

Domestic Booster Pump Systems. A system of booster pump systems located at the water storage tanks and possibly within the distribution system will be used to maintain a uniform operating pressure in each water system. It is anticipated that each booster pump system will include at least three (3) booster pumps plumbed in parallel that will be operated by a variable frequency drive (VFD) controller to control how many pumps are operate at a time and to maintain the pressure requirements for the system. Under low or normal flow conditions it is likely

that a single booster pump is operating and as the water demand increases the standby pumps will turn on to maintain a constant flow and pressure throughout the distribution system.

The booster pump systems will typically be installed in close proximity to the water storage tanks and will be placed in areas that are graded as a result of the storage tanks. The booster pump systems will be installed in small enclosures and in small areas that should not impact sensitive cultural, historical or biotic resources at the site.

Water Distribution Network. The water systems will consist of both branched in in some locations looped water distribution systems. The water systems will consist primarily of 4-inch diameter water mains and 3-inch submains and 3- and 2-inch water laterals to supply the commercial buildings and residential parcels. The majority of the water mains and laterals will be installed in the planned roadways and driveways and will not be installed in undisturbed areas on the site. The installation of the water distribution should not result in any additional impacts to cultural, historic or biotic resources related to the installation of the new roads.

7.2. Non-Potable Water System Improvements

As discussed above, two non-potable water system will be installed to serve development in the Guenoc Valley and a second system to serve the projects in the Upper Bohn Lake area.

In general, both non-potable systems will include a new non-potable water distribution, new surface water pumping systems, and wastewater recycling systems. One or more new groundwater supply wells will be installed to meet the non-potable demand.

Non-Potable Water Distribution Systems. The non-potable water distribution will be constructed to supply fire, irrigation and make up water demands for the site. The non-potable water distribution system will be a "purple pipe" system so that it can convey recycled water, as well as other sources of non-potable through the distribution system. The non-potable water distribution system will serve fire hydrants and external and internal fire sprinkler systems for commercial and residential buildings. The non-potable water distribution system will consist primarily of 10-inch, 8-inch, and 6-inch water mains and submains, and 4-inch, 3-inch, and 2-inch diameter laterals to serve fire sprinkler systems and residential properties. The majority of the non-potable water distribution system will be installed in planned roadways and driveways and should not result in additional land disturbance and impacts to cultural, historic and biotic resources beyond impacts resulting from the construction of the new roads.

Surface Water Pumping Plants. Both non-potable water systems will include new pumping systems located in the vicinity of the existing pumping systems at Detert, McCreary, Lower Bohn Lake, and Upper Bohn Lake. A new pump station will be installed in the vicinity of the flashboard dam installed across Bucksnort Creek downstream of McCreary Reservoir and this pump station will house one pumping system to serve the Equestrian Center. Figure 2 shows the approximate location of the new surface water pumping plants.

The new surface water pump stations on Detert and McCreay Reservoirs will be connected to the Guenoc Valley non-potable water system and will be used to supply irrigation, fire protection and make up water for water features and ponds in this area. The surface water pump stations placed on Lower Bohn Lake and Upper Bohn Lake will be used to pump water to the non-potable

water system in the Upper Bohn Lake Region for irrigation, fire protection and make up water for evaporative losses in water features and ponds.

The new surface water pump stations at the reservoirs will be installed adjacent to the existing pumping plants and will be placed in areas that have been graded and should not result in substantial ground disturbance during their construction and installation. The new pumping plant at Bucksnort Creek will be placed in a small area above the normal highwater mark and outside of the immediate riparian zone of the creek. It will likely be within 50 feet of the creek and with the riparian zone; however, it will be constructed in a location that will minimize impacts to sensitive cultural, historic and biotic resources in this area.

The surface water pumps will likely be a turbine style pump that can deliver a high volume of water at a relatively high pressure to supply fire hydrants and large irrigation demands at certain parts of the property.

Water Reclamation (Recycled) Plants. Based on the decentralized and clustered development plan several small package type water recycling plants will be installed to treat wastewater from the development areas. Nine small package plants are current planned to serve the Phase I project and will include small treatment works at the Maha Farm, Redhill/Renassiance Golf Course, Resort at Trout Flat, Central Back of the House, Equestrian Center, Bohn Ridge Resort, the Spa, Onsite Workforce Housing, and a small system at the Camping Area. Figure 3 shows the approximate location of the nine (9) systems.

The treatment systems will be designed to meet State Title 22 recycled water regulations for tertiary level disinfected recycled water that can be used for unrestricted irrigation and recreational use of the water.

At each water reclamation facility there will be a recycled water storage tank and booster pump system that will pump recycled water into the non-potable water distribution system for landscape irrigation, fire protection and make up water to ornamental water features and ponds.

Each water reclamation plant will cover a relatively small area ranging from less than 1,000 square feet at the Camping Area to the largest area of 12,500 square feet for the largest system that will serve the Maha Farms area. The installation of all the water reclamation plants will require approximately one (1) acre of land. Figure 4 shows the typical layout of a water reclamation plant facility including the treatment plant, storage tank and related parking area.

The water reclamation plants will be placed in areas that are set back from the cluster developments to avoid potential odor and noise issues. The plants will be located close to planned roads to provide easy access to them and to avoid the need to construct long driveways or access roads to serve them. The plants will also be placed in area that will minimize grading and ground disturbance to the extent practical and to avoid impacts to sensitive flora and fauna.

Guenoc Ranch Irrigation Well and Conveyance Line. As previously discussed, the Property Owner (Lotusland Investment Holdings LLC) has purchased an off-site irrigation well in the vicinity of 20740 S. State highway 29 and 20830 S. State Highway 29. This high production well will be used as a primary source of non-potable water to supply irrigation, fire protection and make up water for water features and ponds, if required.

The condition of this well is marginal and appears to be partially filled with sand. Based on this condition the well will either be reconstructed or replaced in-kind. Based on a preliminary review of groundwater conditions at the site, it is likely that the well is constructed in old alluvium deposits derived from old channels of Putah and St. Helena Creek and possibly old lake or wetland deposits. The alluvium is estimated to be approximately 260 to 300 feet deep, and overlays low yielding hard bedrock. Pump test results indicate that the well has a high production capacity measured at 1,100 gallons per minute. A new well would be designed with a relatively large diameter (12-inch) casing and fitted with either a high capacity turbine or submersible style pump to yield high flows over 1,000 gallons per minute.

The well pump system will be connected to a long water conveyance line (8- to 10-inch diameter line) that will run parallel to Butts Canyon Road to convey groundwater to the property site. It is likely that the conveyance line will pump the water to Detert Reservoir.

The existing well is on land currently used for pasture and this use is assumed to continue and the reconstruction or replacement of the well will result in temporary and short-term constructed related localized impacts.

The new water conveyance line will be approximately 6 miles long and will be installed within the public right-of-way along Butts Canyon Road. The pipeline trench will likely be 24-inch wide by 40-inch deep. The construction of the pipeline and trench will require an encroachment permit from the County or State. The conveyance line will be installed in planned roadways where possible and should not result in additional land disturbance and impacts to cultural, historic and biotic resources beyond impacts resulting from the construction of the new roads.

1.0 INTRODUCTION

This report describes the methods and results of a delineation of aquatic resources within the approximately 5,350-acre Study Area for Phase 1 of the proposed Maha Resort and Guenoc Valley Development located on the approximately 22,695-acre Guenoc Ranch. The Ranch is located in unincorporated Lake and Napa counties, California, with the Phase 1 Study Area occurring entirely within Lake County (Figure 1, Figure 2). The Ranch contains a mix of undeveloped lands, agricultural lands including cattle pastures and vineyards, and minor areas of infrastructure to support vineyard, winery, and cattle operations.

On multiple dates in 2018 and 2019, WRA conducted a routine delineation within the Study Area to identify wetlands and non-wetland waters (also referred to as "other waters") potentially subject to jurisdiction by the U.S. Army Corps of Engineers (Corps) under Section 404 of the Clean Water Act (CWA) and/or Section 10 of the Rivers and Harbors Act (RHA). The following sections describe the regulatory background and methods used to guide the delineation and provide a summary of potentially jurisdictional wetlands and non-wetland waters within the Study Area.

2.0 REGULATORY BACKGROUND

2.1 Section 404 of the Clean Water Act

Section 404 of the Clean Water Act gives the Environmental Protection Agency (EPA) and the Corps regulatory and permitting authority regarding discharge of dredged or fill material into "navigable waters of the United States." Section 502(7) of the CWA defines "navigable waters" as "waters of the United States, including territorial seas." Section 328 of Chapter 33 in the Code of Federal Regulations (CFR) defines the term "waters of the United States" as it applies to the jurisdictional limits of the authority of the Corps under the CWA. A summary of the definition of "waters of the United States" in 33 CFR 328.3 (a) includes (1) waters used for commerce; (2) interstate waters and wetlands; (3) territorial seas; (4) impoundments of waters listed here; (5) tributaries to the above waters; (6) waters and wetlands adjacent to the above waters; and (7) prairie potholes, Carolina and Delmarva bays, pocosins, western vernal pools, and Texas coastal prairie wetlands, provided these features have a significant nexus to the above listed waters[1]; (8) all waters located within the 100-year floodplain of waters listed above in items 1-3 or within 4,000 feet of the high tide line (HTL) or ordinary high water mark (OHWM) of a water listed above in items 1-5, provided those waters are determined to have a significant nexus to waters identified in items 1-3 above. For purposes of the determining Corps jurisdiction under the CWA, "navigable waters" as defined in the CWA are the same as "waters of the U.S." defined in 33 CFR 328.3.

Areas not considered to be "waters of the United States" as defined in 33 CFR 328.3 (b), are summarized as follows: (1) waste treatment systems; (2) prior converted cropland; (3) specific classes of ditches, including (i) ditches with ephemeral flow that are not a relocated tributary or excavated in a tributary, (ii) ditches with intermittent flow that are not a relocated tributary, excavated in a tributary, or drain wetlands, and (iii) ditches that do not flow, either directly or through another water, into a water identified in 33 CFR 328.3 paragraphs (a) (1) through (3);

[1] Wetlands and non-wetland waters in this category are similarly situated and are combined, for purposes of a significant nexus analysis, in the watershed that drains to the nearest water identified in paragraphs (a)(1) through (3) of 33 CFR 328.3.

ENVIRONMENTAL CONSULTANTS

(4) artificially irrigated areas that would otherwise revert to dry land and manmade aquatic features in otherwise dry land such as stock watering ponds, irrigation ponds, settling basins, fields flooded for rice growing, log cleaning ponds, cooling ponds, reflecting pools, swimming pools, small ornamental waters, depressions incidental to mining and construction activity, erosional features, and puddles; (5) groundwater; (6) stormwater control features; (7) wastewater recycling structures, groundwater recharge basins, percolation ponds for wastewater recycling, and distribution networks for wastewater recycling.

2.1.1 Wetlands

Wetlands are defined in 33 CFR 328.3 (c) as:

> *…those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.*

The basis for determining whether a given area is a wetland for the purposes of Section 404 of the CWA is outlined in the Corps *Wetlands Delineation Manual* (Environmental Laboratory 1987) and the *Regional Supplement to the Corps of Engineers* Delineation Manual for the respective region. As defined in 33 CFR 328.4 (c), the extent of federal jurisdiction within wetlands is defined as extending to the limit of the wetland as determined using the methods outlined in the manuals.

2.1.2 Non-Wetland Waters

The limit of federal jurisdiction in tidal non-wetland waters extends to the HTL which is defined in 33 CFR 328.4 (a) as:

> *...the line of intersection of the land with the water's surface at the maximum height reached by a rising tide. The high tide line may be determined, in the absence of actual data, by a line of oil or scum along shore objects, a more or less continuous deposit of fine shell or debris on the foreshore or berm, other physical markings or characteristics, vegetation lines, tidal gages, or other suitable means that delineate the general height reached by a rising tide. The line encompasses spring high tides and other high tides that occur with periodic frequency but does not include storm surges in which there is a departure from the normal or predicted reach of the tide due to the piling up of water against a coast by strong winds such as those accompanying a hurricane or other intense storm.*

The limit of federal jurisdiction in non-tidal non-wetland waters extends to the OHWM which is defined in 33 CFR 328.3 (e) as:

> *...that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impresses on the bank, shelving, changes in the characteristics of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.*

2.2 Section 10 of the Rivers and Harbors Act

The Corps also has jurisdiction over "navigable waters" under Section 10 of the Rivers and Harbors Act of 1899. Section 10 of this Act applies to tidal areas below mean high water (MHW) and includes tidal areas currently subject to tidal influence, as well as historic tidal areas behind levees that both historically and presently reside at or below MHW. "Navigable waters of the U.S.", as defined in 33 CFR 329.4, are "those waters that are subject to the ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce."

The act prohibits any unauthorized action that obstructs navigable capacity. These actions can include building of structures; excavation, fill; and alterations and modifications to navigable waters (33 USC 403). A determination of navigability, once made, applies laterally over the entire surface of the waterbody, and is not extinguished by later actions or events which impede or destroy navigable capacity. The upper limit of navigable water is at the point along its length where the character of the river changes from navigable to non-navigable, such as at a major fall or rapids. Since the upper limit of navigability of waterways under Section 10 is sometimes difficult to discern, determinations of navigability under Section 10 are often made by the Corps and kept on file, independent of submitted permit applications or delineations.

3.0 STUDY AREA DESCRIPTION

3.1 Land Use

Guenoc Ranch is an approximately 22,695-acre property located in unincorporated Lake and Napa counties, approximately 6 miles southeast of the town of Middletown (Figure 1). The property contains a mix of undeveloped lands, agricultural lands including cattle pastures and vineyards, and minor areas of infrastructure to support vineyard, winery, and cattle operations. The property is bounded to the north by the U.S. Coast Guard LORAN Reservation, Putah Creek, and the Cedars mountain range; to the east by Putah Creek and Mysterious Valley; to the south by Table Mountain and the Pope Valley; and to the west by Long Valley and Coyote Valley.

The approximately 5,350-acre Phase 1 Study Area that was examined for this report contains a subset of Guenoc Ranch that occurs entirely within Lake County. The location and extent of the Phase 1 Study Area is shown on Figure 2.

3.2 Vegetation

The Study Area is located within the Inner North Coast Ranges geographic subdivision described by the Jepson Flora Project (2019). This area is characterized by widespread serpentine and volcanic soils experiencing relatively low rainfall and hot, dry summers; the resulting vegetation is dominated by a mix of chaparral, foothill pine woodland, and blue oak woodland, with grasslands in valley bottoms and alluvial positions. As is the case with Guenoc Ranch, many of the valley bottoms and alluvial positions throughout the region have been converted for grazing lands, vineyards, or other agricultural uses.

The Study Area is dominated by a mix of blue oak woodland, foothill pine woodland, chamise chaparral, scrub and leather oak chaparral, and non-native annual grasslands, with other communities and specific plant communities present over smaller areas. The large number of ponds, reservoirs, and major streams on the property have also resulted in a large amount of

wetlands and wet meadow features. Many of these features have been historically altered to support ranching and agricultural activities.

The Study Area contains a large area of serpentine soils dominated by a mix of foothill pine woodland and chaparral communities. These serpentine habitats have a high concentration of native plant species compared to adjacent habitats on non-serpentine soils which are dominated by blue oak woodlands with a high concentration of non-native and invasive species in the understory. Serpentine habitats within the Study Area also contain a high concentration of special-status plant species.

Portions of the Study Area burned during the Valley Fire of 2015. In some areas, the burn was light and the pre-fire vegetation was not completely destroyed. In other areas, the burn was severe and the pre-fire vegetation was killed. In these areas, vegetation that was once dominated by foothill pine woodland or other woodland types has transitioned to shrub-dominated habitats such as scrub or leather oak chaparral. It is anticipated that vegetation in burn-affected areas will transition through a number of stages over the coming years to decades.

3.3 Soils

Guenoc Ranch contains a variety of geologic substrates including ultramafic rocks (primarily serpentinite, with minor inclusions of peridotite, gabbro, and diabase), rocks of the Franciscan complex (primarily sandstone with smaller amounts of shale, chert, limestone, and conglomerate), and volcanic flow rocks of the Clear Lake Volcanic Field (volcanic flow rocks with minor pyroclastic deposits, primarily andesite with minor amounts of dacite and basalt) (USGS 2017).

Soils mapped within Guenoc Ranch are shown on Figure 3. A list of soils and their acreages within the Study Area, as well as their parent material, is provided as Table 1. (CSRL 2018; USDA 1989). The ultramafic, or serpentine, origin of many of the soils found within the Study Area results in a unique physical and chemical composition that hinders the growth of most species that have not evolved on these soil types. As a result, serpentine soils harbor unique native plant assemblages that are resistant to invasion by non-native species and often support numerous special-status plants that are restricted to serpentine soils (Kruckeberg 1984; Alexander et al. 2007).

3.4 Hydrology

Guenoc Ranch experiences a Mediterranean climate, with cool, wet winters and hot, dry summers. Average annual rainfall is approximately 43 inches, as measured at the Natural Resources Conservation Service (NRCS) weather station in Middletown, approximately 3.5 miles to the west of the site. The majority of rain falls between November and March. Average annual temperature is 51 degrees Fahrenheit, as measured at the NRCS weather station in Clear Lake, approximately 10 miles to the northwest of the property. The average summer temperature (June through August) is 71 degrees Fahrenheit; the average winter temperature (December through February) is 44 degrees. Nearly all precipitation falls as rain.

Guenoc Ranch is located entirely within the Putah Creek watershed which drains into Lake Berryessa, located approximately 8 miles to the southeast of the property. The property contains significant hydrologic resources, with a large network of ponds and reservoirs connected by perennial to intermittent streams and agricultural ditches and channels. Putah Creek, a perennial stream, runs along the northern and eastern portions of the property, and many of the drainages within the property drain into Putah Creek. Other major creeks within the property include Bucksnort Creek, Butcherknife Creek, Hunting Creek, Butts Creek, and Cassidy Creek. Major ponds and reservoirs within the Property include Detert Reservoir, McCreary Lake, Lake Burgundy, Lake Bordeaux, Upper Bohn Lake, Lower Bohn Lake, and Amel Lake.

4.0 METHODS

WRA biologists performed a delineation of aquatic resources within the Phase 1 Study Area on multiple dates between 2018 and 2019. Prior to conducting the evaluation, WRA reviewed a range of background materials including the *Soil Survey of Lake County* (USDA 1989), the California Soil Resource Lab's (CSRL) online soil viewer (CSRL 2019), the National Wetland Inventory (NWI; USFWS 2019), and the U.S. Geological Survey (USGS) Jericho Valley, Detert Reservoir, and Aetna Springs 7.5-minute quadrangle maps. WRA also reviewed historic aerial imagery from Google Earth (2019).

During the on-site evaluation, WRA followed the methods outlined in *U.S. Army Corps of Engineers Wetlands Delineation Manual* (Corps Manual; Environmental Laboratory 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Arid West Supplement; Corps 2008), and *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* ("OHWM Guide"; Lichvar and McColley 2008). The jurisdictional wetlands were identified and their boundaries mapped using the Routine Method described in the Corps Manual. The jurisdictional limits of non-wetland waters under Section 404 of the CWA were mapped based on a combination of field indicators described in the OHWM Guide and Regulatory Guidance Letter 05-05 (Corps 2005).

4.1 Section 404 of the Clean Water Act

4.1.1 Wetlands

Routine Method

WRA followed the Routine Method to evaluate the Study Area for the presence or absence of indicators of the three wetland parameters described in the Corps Manual (Environmental Laboratory 1987) and Arid West Supplement (Corps 2008). Data on vegetation, hydrology, and soils were collected at sample points within potential wetland communities and adjacent upland areas. Sample points that contained positive indicators for hydrophytic vegetation, hydric soils, and wetland hydrology were considered to be wetland. Except in cases of atypical or problematic wetland situations (i.e., difficult wetland situations, as described below), sample points that lacked one or more indicators were considered to be upland. Sample point data were reported on Arid West Supplement data forms. Sample point locations were recorded using a handheld GPS unit with sub-meter accuracy.

Wetland boundaries were identified using a combination of indicators observed on the ground, most often minor shifts in topography and changes in dominant vegetation, in addition to other indicators. Where wetland boundaries were broad and difficult to determine in the field, wetland signatures visible in recent and historical aerial imagery from Google Earth and high resolution aerial imagery from April to August 2016 acquired from Hexagon were used to determine boundaries. Based on a WETS hydrological analysis (see summary below and full analysis in Appendix A), WRA determined that the photos represent periods with normal precipitation levels. Using imagery from normal periods allowed WRA to identify the normal extent of wetland conditions across the site.

WRA also utilized high resolution topographic data derived from the USGS Lake County Lidar date set (USGS 2017). The Lidar data was processed into a Digital Elevation Model (DEM) raster with a horizontal resolution of 1 ft. x 1 ft. using ArcGIS software. The high resolution aerial imagery and elevation data were utilized during heads-up digitizing to refine wetland and stream boundaries.

Difficult Wetland Situations

The Arid West Supplement (Corps 2008) includes recommended procedures for completing wetland delineations in areas of “difficult wetland situations” in which wetlands may lack one or more indicators due to natural or anthropogenic factors. Although the Corps Manual and Arid West Supplement were utilized in the wetland determination, they do not provide exhaustive lists of the difficult situations and problem areas that can arise during delineations in the Arid West. In these situations, the Corps Manual and Regional Supplements stress the importance of using best professional judgment and knowledge of the ecology of the wetlands in the region during the collection and interpretation of data in difficult sites.

Difficult wetland situations within the Phase 1 Study Area included (1) the presence of reed fescue (*Festuca arundinacea*, FACU) displaying morphological adaptations to wetlands (i.e., hummocky growth to elevate the plants above the saturated zone) and (2) the presence of dark (N 2.5/0) serpentine soils that may mask redox features. When reed fescue was observed displaying morphological adaptations to saturated soils, it was reclassified from FACU to FAC and the dominance test was recalculated following the morphological adaptations guidance from the Arid West Manual. When dark soils were encountered with no apparent redoximorphic features, they were assumed to be upland soils when hydrophytic vegetation and wetland hydrology were absent and were assumed to be hydric soils when hydrophytic vegetation and wetland hydrology were present.

WETS Analysis

A hydrologic analysis (i.e., WETS analysis; USDA 1997; Sprecher and Warne 2000) was conducted to determine whether precipitation levels during the three months prior to each aerial image used by WRA and prior to each site visit were above, below, or within the 30-year average for the region. Long-term precipitation data (i.e., the WETS table) were obtained from weather stations in nearby Middletown, located approximately 6 miles west of the Study Area, and Clear Lake, located approximately 10 miles northwest of the Study Area, part of the National Weather Service Cooperative Network. Daily precipitation data for the three months preceding the date of each aerial image used by WRA, as well as for the date of each site visit by WRA, were obtained from the Middletown 0.1P weather station located approximately 6 miles west of the Study Area. A summary of the results of the WETS analysis is provided below in Table 2; the full analyses are provided as Appendix A.

Table 2. Summary of WETS Precipitation Analysis

Date	Description	Relative Precipitation Levels
May 2016	Date of commercial aerial imagery	Normal rainfall
June 2016	Date of commercial aerial imagery	Normal rainfall
July 2016	Date of commercial aerial imagery	Normal rainfall
August 2016	Date of commercial aerial imagery	Normal rainfall
May 1-4, 2018	Delineation site visit	Normal rainfall
May 30-June 1, 2018	Delineation site visit	Above normal rainfall
August 21-22, 2018	Delineation site visit	Normal rainfall
September 6-7, 2018	Delineation site visit	Normal rainfall
April 24-26, 2019	Delineation site visit	Above normal rainfall
May 2-3, 2019	Delineation site visit	Above normal rainfall
May 7-9, 2019	Delineation site visit	Above normal rainfall
June 17, 2019	Delineation site visit	Above normal rainfall
June 20, 2019	Delineation site visit	Above normal rainfall

4.1.2 Non-Wetland Waters

This study also evaluated the presence of non-wetland waters potentially subject to Corps jurisdiction under Section 404 of the CWA. Non-wetland waters subject to Corps jurisdiction include lakes, rivers, and streams (including intermittent and ephemeral streams).

The OHWM was used to identify the extent of Corps jurisdiction over non-wetland waters under Section 404 of the CWA. The location of the OHWM was determined based on a combination of indicators observed on the ground (e.g., water stains or scour marks). The width between the OHWM on either side of each feature was visually estimated in the field and, when possible, the segments of the centerline or edges were mapped using handheld GPS units with sub-meter accuracy.

4.2 Section 10 of the Rivers and Harbors Act

To determine the presence of non-wetland waters potentially subject to Corps jurisdiction under Section 10 of the RHA, WRA reviewed the online mapping tool hosted on the Corps Sacramento District's website[2]. Based on the mapper, no non-wetland waters within the Study Area are subject to Corps jurisdiction under Section 10 of the Rivers and Harbors Act.

5.0 RESULTS

As described in Section 3.0, the property contains significant hydrologic resources, with a large network of ponds and reservoirs connected by perennial to intermittent streams and agricultural ditches and channels. The entirety of the Study Area is located within the watershed of Putah Creek, which ultimately drains into the Sacramento River, a traditional navigable water of the United States.

Descriptions of the aquatic resources identified within the Study Area that are potentially subject to federal jurisdiction under Section 404 of the CWA are provided in the following sections. A summary of aquatic resource acreages is provided in Table 3. WETS analyses for aerial imagery and fieldwork dates are included as Appendix A. Maps showing the location and extent of aquatic resources mapped within the Study Area are provided as Appendix B. Wetland Determination Data Forms are provided as Appendix C. Photographs of the Study Area are provided as Appendix D. A list of all plant species observed during the delineation site visits is included as Appendix E.

5.1 Section 404 of the Clean Water Act

5.1.1 Wetlands

Forested Wetlands

Within the Study Area, forested wetlands occur along a low-gradient portion of Butcherknife Creek, where a stand of trees was present. In the overstory, vegetation was dominated by white alder (*Alnus rhombifolia*; FACW). In the understory, vegetation was dominated by torrent sedge (*Carex nudata*; FACW), tule (*Schoenoplectus acutus* ssp. *occidentalis*; OBL), reed fescue (*Festuca arundinacea*; FACU), and dallis grass (*Paspalum dilatatum*; FAC). Hydric soils were assumed based on the presence of perennial surface water and the fact that hydrophytic vegetation and several indicators of wetland hydrology were met. Primary indicators of wetland

hydrology included Surface Water (A1), High Water Table (A2) (assumed based on perennial surface water), and Saturation (A3); secondary indicators included Water Marks (Riverine) (B1), Drift Deposits (Riverine) (B2), and FAC-Neutral Test (D5). Wetland boundaries were determined based primarily on the edge of tree canopy.

Forested wetlands were classified as PFO1E: Palustrine (P), forested (FO), broad-leaved deciduous (1), and seasonally flooded/saturated (E).

Scrub-Shrub Wetlands

Within the Study Area, scrub-shrub wetlands occurred along low-gradient portions of Butts Creek, where shrub stands were present. In the shrub layer, the vegetation was dominated by Brewer's willow (*Salix breweri*; FAC), with other species such as coffeeberry (*Frangula californica*; NL), spice bush (*Calycanthus occidentalis*; FAC), and western azalea (*Rhododendron occidentale*; FAC) as co-dominants. In the herbaceous layer, the vegetation was typically sparse and included species such as cobwebby hedge nettle (*Stachys albens*; OBL) and seep monkeyflower (*Mimulus guttatus*; OBL). Hydric soils were assumed based on the extended presence of surface water and the fact that hydrophytic vegetation and several indicators of wetland hydrology were met. Primary indicators of wetland hydrology included Surface Water (A1), High Water Table (A2) (assumed based on perennial surface water), and Saturation (A3); secondary indicators included Water Marks (Riverine) (B1), Drift Deposits (Riverine) (B2), and FAC-Neutral Test (D5). Wetland boundaries were determined primarily based on the edge of the shrub canopy.

Scrub-shrub wetlands were classified as PSS1CE: Palustrine (P), scrub-shrub (SS), broad-leaved deciduous (1), and seasonally flooded (C) or seasonally flooded/saturated (E).

Seasonal Wetland Depressions

Features in the seasonal wetland depressions category are closed depressions that are seasonally inundated by surface runoff and groundwater and are situated outside of other aquatic features. Seasonal wetland depressions are numerous within the former golf course within the western portion of the Study Area but are otherwise infrequent and scattered within the Study Area. Vegetation was dominated by spike rush (*Eleocharis macrostachya*; OBL), hairy cats ear (*Hypochaeris radicata*; FACU), annual beard grass (*Polypogon monspeliensis*; FACW), meadow barley (*Hordeum brachyantherum*; FACW), valley sedge (*Carex barbarae*; FAC), and broadleaf cattail (*Typha latifolia*; OBL). Soils were generally loam with matrix colors of dark brown (7.5YR 3/3) or dark reddish brown (5YR 3/3), or clay with colors of very dark gray (2.5Y 3/1), very dark greenish gray (10Y 3/1), and black (10YR 2/1, 2.5Y 2.5/1), and redoximorphic features consisting of black (7.5YR 2/1) manganese concentrations and yellowish red (5YR 4/6) and olive (5Y 4/4) iron concentrations at 2 to 5 percent cover as masses in the matrix. Soils met the Redox Dark Surface (F6) hydric soil indicator, and in several situations, the problematic hydric soil indicator. At SP-116, the dark reddish brown matrix may have been masking redoximorphic concentrations, hydrophytic vegetation and wetland hydrology indicators were met, and the feature was a shallow, seasonally ponded depression. At SP-124 and SP-126, the dark serpentine soils may have masked redoximorphic features, hydrophytic vegetation and wetland hydrology indicators were met, and the feature was a shallow, seasonally ponded depression. Indicators of wetland hydrology consisted of primary indicators including High Water Table (A2), Saturation (A3), Inundation Visible on Aerial Imagery (B7), and Biotic Crust (B12), Redox Dark Surface (F7); secondary indicators of wetland hydrology included Saturation Visible on Aerial Imagery (C9) and FAC-Neutral Test (D5). Wetland boundaries were determined based on a shift in vegetation and topography.

Seasonal wetland depressions were classified as PEM2C: Palustrine (P), emergent (EM), non-persistent (2), and seasonally flooded (C).

Seasonal Wetland Ditches

Features in the seasonal wetland ditch category are man-made, linear ditch features that are adjacent and parallel to roads and are designed to convey surface water. These features are seasonally inundated and/or saturated for a duration sufficient to support wetland conditions. Seasonal wetland ditches are infrequent and scattered within the Study Area. Vegetation was dominated by Italian rye grass, reed fescue, and annual beard grass. Hydric soils were assumed based on the summer presence of surface water and saturated soils and the fact that hydrophytic vegetation indicators were met. Indicators of wetland hydrology included Surface Water (A1), Saturation (A3), and High Water Table (A2). Wetland boundaries were determined based on a shift in vegetation and topography.

Seasonal wetland ditches were classified as PEM2Cx: Palustrine (P), emergent (EM), non-persistent (2), seasonally flooded (C), and excavated (x).

Seasonal Wetland Pond Fringes

Features in the seasonal wetland pond fringes category are located adjacent to and directly connected to bodies of open water such as ponds and reservoirs. These features are typically inundated when the bodies of open water at are their seasonal maximum extent and dry down as the open water feature dries down. Seasonal wetland pond fringes are infrequent and scattered throughout the Study Area. Vegetation was dominated by spikerush, annual beard grass, variegated clover (*Trifolium variegatum*; FAC), Mediterranean barley (*Hordeum marinum*; FAC), Jepson's button celery (*Eryngium aristulatum* var. *aristulatum*; OBL), soft chess (*Bromus hordeaceus*; FACU), and broadleaf cattail. Soils were generally loamy clay or cobbly loam with matrix colors of olive gray (5Y 4/2) or dark brown (7.5YR 3/2) and redoximorphic features consisting of olive (5Y 5/6) dark reddish brown (5YR 3/4) iron concentrations and black (N2.5/-) manganese concentrations occurring as masses within the matrix or along pore linings at 2 to 4 percent. Soils most often met the Depleted Matrix (F3) and Redox Dark Surface (F6) hydric soil indicators. Primary indicators of wetland hydrology included Inundation Visible on Aerial Imagery (B7), Water-Stained Leaves (B9) Biotic Crust (B12), and Oxidized Rhizospheres Along Living Roots (C3); secondary indicators included Saturation Visible on Aerial Imagery (C9) and FAC-Neutral Test (D5). Wetland boundaries were determined based on a shift in vegetation and topography.

Seasonal wetland pond fringes were classified as PEM1/2C: Palustrine (P), emergent (EM), persistent (1) to non-persistent (2), and seasonally flooded (C).

Seasonal Wetland Seeps/Swales

Features in the seasonal wetland seeps/swales category are typically shallow, linear, open depressions that convey flows but lack OHWM indicators and remain inundated and/or saturated for a duration sufficient to support wetland conditions. This category also includes seeps situated on slopes that support wetland conditions but are not linear depressions. Seasonal wetland seeps/swales may occur singularly or as part of a network of aquatic features such as ephemeral drainages or other swales and can occur as part of a network. These features are abundant throughout the Study Area, regardless of slope, aspect, or vegetation type. Vegetation was

dominated by species such as Mexican rush, iris-leaved rush (*Juncus xiphioides*; OBL), reed fescue, Mediterranean barley, bird's-foot trefoil (*Lotus corniculatus*; FAC), Bermuda grass (*Cynodon dactylon*; FACU), bifid sedge (*Carex serratodens*; FACW), marsh zigadenus (*Toxicoscordion fontanum*; OBL), and Italian ryegrass. Soils were generally loams, loamy clays, or clays with matrix colors of very dark gray (2.5Y 3/1), dark olive gray (5Y 3/2), black (5Y 2.5/1, 10YR 2/1, 2.5Y 2.5/1), and very dark grayish brown (10YR 3/2) and redoximorphic features consisting of brown (7.5YR 4/4), strong brown (7.5YR 4/6), dark yellowish brown (10YR 3/4, 10YR 3/6) iron concentrations occurring in the matrix and along pore linings as soft masses at 5 to 30 percent. Soils most often met the Redox Dark Surface (F6) hydric soil indicator. In some cases, the problematic hydric soil indicator was met because the dark serpentine soils may have masked redoximorphic features, hydrophytic vegetation and wetland hydrology indicators were met, and the feature was in an area that seasonally ponded. Primary indicators of wetland hydrology included Surface Water (A1), Saturation (A3), Biotic Crust (B12), and Oxidized Rhizospheres Along Living Roots (C3); secondary indicators included Saturation Visible on Aerial Imagery (C9) and FAC-Neutral Test (D5). Wetland boundaries were most commonly determined based on a shift in vegetation and topography.

Seasonal wetland seeps/swales were classified as PEM2C: Palustrine (P), emergent (EM), non-persistent (2), and seasonally flooded (C).

Seasonal Wetland Wet Meadows

Features mapped as seasonal wetland wet meadows are broad, flat to gently sloping, non-depressional areas characterized by herbaceous vegetation that support wetland conditions. These features often occur in valley bottoms or in flats at the bases of slopes and may intergrade with or have direct connection with other aquatic features. They vary in size from less than 0.5 acre to as much as approximately 11 acres. Within the Study Area, seasonal wetland wet meadows are infrequent and scattered. Vegetation was dominated by spikerush, wild licorice (*Glycyrrhiza lepidota*; FAC), Italian ryegrass (*Festuca perennis*; FAC), Mediterranean barley, curly dock (*Rumex crispus*; FAC, cobwebby hedge nettle, Mexican rush (*Juncus mexicanus*; FACW), and reed fescue. Soils were clay or clay loam with matrix colors of black (5Y 2.5/1, 10YR 2/1), dark grayish brown (10YR 4/2), very dark gray (7.5YR 3/1) with redoximorphic features consisting of dark reddish brown (5YR 3/4), strong brown (7.5YR 4/6), and dark brown (7.5YR 3/3) iron concentrations occurring as soft masses in the matrix and along pore linings at 5 to 20 percent. Soils most often met the Redox Dark Surface (F6) and Depleted Matrix (F3) hydric soil indicator. In some cases, the problematic hydric soil indicator was met because the dark serpentine soils may have masked redoximorphic features, hydrophytic vegetation and wetland hydrology indicators were met, and the feature was in an area that seasonally ponded. Primary indicators of wetland hydrology include Surface Water (A1), Oxidized Rhizospheres Along Living Roots (C3); secondary indicators include Drainage Patterns (B10), FAC-Neutral Test (D5), Saturation Visible on Aerial Imagery (C9). Wetland boundaries were most often determined based on topography and a shift in vegetation.

Seasonal wetland wet meadows were classified as PEM2C: Palustrine (P), emergent (EM), non-persistent (2), and seasonally flooded (C).

Stream Fringe/In-Stream Wetlands

Features mapped in the stream fringe/in-stream wetlands category are typically flat to gently sloping areas situated adjacent to intermittent and perennial streams and characterized by perennial herbaceous vegetation. This category also includes low-gradient channels that have

the appearance of streams but lack indicators of OHWM and are fully vegetated with perennial graminoids. Stream fringe/in-stream wetlands are fairly abundant throughout the Study Area. Vegetation was dominated by spike rush, Mexican rush, iris-leaved rush, annual beard grass, Italian rye grass, bird's-foot trefoil, Bermuda grass. Soils were most often loam, clay loams, or clay with matrix colors of very dark grayish brown (10YR 3/2), dark brown (7.5YR 3/2), black (10YR 2/1), dark gray (5Y 4/1, 10YR 4/1), and very dark gray (10YR 3/1) with redoximorphic features consisting of dark gray (10YR 4/1) depletions and dark olive brown (2.5Y 3/3) and dark brown (7.5YR 3/4) and strong brown (7.5YR 4/6) iron concentrations and occurring as soft masses in the matrix and pore linings at 2 to 40 percent. Soils most often met the Depleted Matrix (F3), Depleted Dark Surface (F7), and Redox Dark Surface (F6) hydric soil indicators. Primary indicators of wetland hydrology included Surface Water (A1), Biotic Crust (B12) and Oxidized Rhizospheres Along Living Roots (C3); secondary indicators included Saturation Visible on Aerial Imagery (C9), Sediment Deposits (Riverine) (B2), and FAC-Netral Test (D5). Wetland boundaries were determined based on topography and a shift in vegetation.

Stream fringe/in-stream wetlands were classified as R4SB7: Riverine (R), intermittent (4), streambed (SB), and vegetated (7).

5.1.2 Non-Wetland Waters

For the purposes of this report, stream features were classified as ephemeral, intermittent, or perennial based on the County Code, which defines streams based on their symbology on USGS maps, with solid blue line streams considered perennial, dashed blue line streams considered intermittent, and all other streams considered ephemeral.

Ephemeral Ditch

Features in the ephemeral ditch category are man-made, linear ditch features that are adjacent and parallel to roads and are designed to convey surface water and have indicators of OHWM. These features may convey flows during and immediately after precipitation events but remain dry otherwise. Ephemeral ditches are infrequent and scattered within the Study Area.

Ephemeral ditches were classified as R4SBA/Cx: Riverine (R), intermittent (4), streambed (SB), temporarily flooded (A) to seasonally flooded (C), and excavated (x).

Ephemeral Stream

Features in the ephemeral stream category are naturally formed, linear features that have indicators of OHWM and may convey flows only during or immediately after a precipitation event but remain dry otherwise. Ephemeral streams are the most abundant feature within the Study Area, numbering in the hundreds. They occur on all slopes and aspects and within forested, shrub-dominated, and herbaceous plant communities. Though they most commonly occur on medium- to high-gradient slopes, they also sometimes occur in low-gradient topography.

Ephemeral streams were classified as R4SBA: Riverine (R), intermittent (4), streambed (SB), and temporarily flooded (A).

Intermittent Stream

Features in the intermittent stream category are linear features that have indicators of OHWM and within which water flows for a portion of the year, generally drying out during the driest time of the year. These features are fairly abundant within the Study Area.

Intermittent streams were classified as R4SBC: Riverine (R), intermittent (4), streambed (SB), and seasonally ponded (C).

Perennial Stream

Features in the perennial stream category are linear features that have indicators of OHWM and within which water flows the entire year, even during the dry season. Perennial streams are relatively uncommon within the Study Area but include larger, named streams such as Putah Creek.

Perennial streams were classified as R5UBF & R5UBF/H: Riverine (R), unknown perennial (5), unconsolidated bottom (UB), and semipermanently flooded (F) or semipermanently flooded to permanently flooded (H).

Open Waters

Features in the open waters category correspond to ponds and reservoirs that are typically man-made and range from smaller depressions that pond water only during a portion of the growing to larger features that hold water year round. Open waters features are relatively infrequent and scattered within the Study Area.

Open waters were classified as PUBK: Palustrine (P), unconsolidated bottom (UB), and artificially flooded (K).

5.2 Section 10 of the Rivers and Harbors Act

Based on a review of the Sacramento Corps District's Section 10 online mapping tool, WRA determined that none of the non-wetland waters within the Study Area are subject to Section 10 of the Rivers and Harbors Act.

6.0 CONCLUSION

The results of this delineation of aquatic resources was based on conditions observed during the time of the assessment and information provided to WRA by the property owner and project proponent. It should be noted that the Corps makes all final decisions regarding regulatory jurisdiction, and WRA recommends securing a Jurisdictional Determination from the Corps before embarking on any project activities that could result in the loss of Waters of the United States.

APPENDIX C

WETLAND DETERMINATION DATA FORMS

DRAFT

DRAFT

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/4/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-01**

Investigator(s) Tanner Harris, Rhiannon Korhummel, WRA Section,Township,Range

Landform (hillslope, terrace, etc.) valley floor Local Relief (concave, convex, none) Convex Slope(%) 0-5

Subregion(LRR) LRR C (Medit. CA) Lat: 38.775905 Long: -122.468045 Datum: WGS 84

Soil Map Unit Name Sobrante-Guenoc-Hambright complex, 15 to 30 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☒ Yes ☐ No
Wetland Hydrology Present? ☒ Yes ☐ No

Is the Sampled Area within a Wetland? ☒ **Yes** ☐ **No**

Remarks: Sample point taken in wetland stream fringe associated with perennial stream. Sample point meets criteria for hydrophytic vegetation, hydric soils and wetland hydrology. Boundary determined by changes in topography and vegetation. Paired with upland sample point SP-02.

VEGETATION (use scientific names)

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC? 1 (A)

Total number of dominant species across all strata? 2 (B)

% of dominant species that are OBL, FACW, or FAC? 50 (A/B)

Prevalence Index Worksheet

Total % cover of:		Multiply by:	
OBL species	20	x1	20
FACW species	25	x2	50
FAC species		x3	
FACU species	30	x4	120
UPL species		x5	
Column Totals	75 (A)		190 (B)

Prevalence Index = B/A = 2.5

Hydrophytic Vegetation Indicators

☐ Dominance Test is >50%
☒ Prevalence Index is </= 3.0[1]
☐ Morphological adaptations (provide supporting data in remarks)
☐ Problematic hydrophytic vegetation[1] (explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present ? ☒ Yes ☐ No

Remarks: Thatch=10; Vegetation meets Prevalence Index.

SOIL

Sampling Point SP-01

Profile description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	Matrix %	Redox Features Color (moist)	Redox Features %	Type[1]	Loc[1]	Texture	Remarks
0-12	5B 2.5/0	95	7.5YR 4/6	5	C	M, PL	Sandy clay	Very gritty with many small pebbles

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix. [2]Location: PL=Pore Lining, RC=Root Channel, M=Matrix

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Stratified Layers (A5)(LRR C)
- ☐ 1cm Muck (A9)(LRR D)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☒ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Soils meet Redox Dark Surface (F6).

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☒ Yes ☐ No Depth (inches): 15"

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0-15

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Primary hydrology indicator Saturation (A3) was observed with saturation throughout the profile with an associated water table at 15 inches in depth. One secondary indicator, Saturation Visible on Aerial Imagery (C9), also met.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/4/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-02**

Investigator(s) Tanner Harris, Rhiannon Korhummel, WRA Section,Township,Range

Landform (hillslope, terrace, etc.) valley floor Local Relief (concave, convex, none) convex Slope(%) 0-5

Subregion(LRR) LRR C (Medit. CA) Lat: 38.746333 Long: -122.486211 Datum: WGS 84

Soil Map Unit Name Sobrante-Guenoc-Hambright complex, 2 to 15 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: Shovel refusal

Depth (inches): 4"

Hydric Soil Present ? ☐ Yes ☒ No

Remarks: Shovel refusal at 4" due to rock layer. No indicators of hydric soils observed.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)

- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☐ Yes ☒ No

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: No hydrology observed.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/4/2018

Applicant/Owner Lotusland Investment Holdings State CA Sampling Point **SP-03**

Investigator(s) Aaron Arthur, Russell Andrews; WRA, Inc. Section,Township,Range

Landform (hillslope, terrace, etc.) Hillslope Local Relief (concave, convex, none) Concave Slope(%) 7-10

Subregion(LRR) LRR C (Medit. CA) Lat: 38.771374 Long: -122.455304 Datum: D_WGS_1984

Soil Map Unit Name Henneke-Montara-Rock outcrop complex, 15 to 50 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☒ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☒ Yes ☐ No
Wetland Hydrology Present? ☒ Yes ☐ No

Is the Sampled Area within a Wetland? ☒ **Yes** ☐ **No**

Remarks: Sample point located in seasonal wetland near ridgeline. Sample point meets criteria for hydrophytic vegetation and wetland hydrology. Soils are problematic (serpentine) and assumed to be hydric. Wetland boundary based on shift in vegetation and topography. Paired with SP-04.

- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☒ Yes ☐ No Depth (inches): 2

Water table present? ☒ Yes ☐ No Depth (inches): 0

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Hydrology fed by spring uphill. Hydrology indicators Surface Water (A1), High Water Table (A2), and Saturation (A3) were observed. Surface water was observed, approximately 2 inches in depth.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/2/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-17**

Investigator(s) Scott Yarger, Sammi Hill, WRA Section,Township,Range

- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Inundation Visible on Aerial Imagery (B7) primary hydrology indicator observed. Saturation Visible on Aerial Imagery (C9) also met.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/1/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-21**

Investigator(s) Scott Yarger, Sammi Hill, WRA Section,Township,Range

Landform (hillslope, terrace, etc.) hillslope Local Relief (concave, convex, none) convex Slope(%) 5-10

Subregion(LRR) LRR C (Medit. CA) Lat: 38.766054 Long: -122.431031 Datum: WGS 84

Soil Map Unit Name Henneke-Montara-Rock outcrop complex, 15 to 50 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☐ Yes ☒ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Paired point with SP-20. Sample point located in uplands adjacent to wetland swale at base of ephemeral stream on hillslope.Sample point does not meet criteria for hydrophytic vegetation, hydric soils or wetland hydrology.

- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ Yes ☐ No

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Sample point meets Oxidized Rhizospheres along Living Roots (C3).

- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Sample point met oxidized rhizospheres along living roots wetland hydrology indicators and met Secondary indicator of Saturation Visible on Aerial Imagery (C9).

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/2/2018

Applicant/Owner Lotusland Investment Holdings State CA Sampling Point **SP-29**

Investigator(s) Aaron Arthur, Russell Andrews; WRA, Inc. Section,Township,Range

Landform (hillslope, terrace, etc.) Hillslope Local Relief (concave, convex, none) Concave Slope(%) 2-5

Subregion(LRR) LRR C (Medit. CA) Lat: 38.7639991455 Long: -122.443598811 Datum: D_WGS_1984

Soil Map Unit Name Maxwell clay loam, 2 to 8 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☒ Yes ☐ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point did not meet wetland indicators for hydrophytic vegetation and wetland hydrology. Average rainfall conditions were documented during the site visit. Paired with SP-28.

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Saturation observed in March 2018.

Remarks: Sample point meets Oxidized Rhizospheres along Living Roots (C3).

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/1/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-33**

Investigator(s) Tanner Harris, Rhiannon Korhummel, WRA Section,Township,Range

Landform (hillslope, terrace, etc.) hillslope Local Relief (concave, convex, none) convex Slope(%) 20

Subregion(LRR) LRR C (Medit. CA) Lat: 38.76312 Long: -122.43943 Datum: WGS 84

Soil Map Unit Name Maxwell clay loam, 2 to 8 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☐ Yes ☒ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point located in adjacent uplands to seep in hillslope. Sample point does not meet criteria for hydrophytic vegetation, hydric soils or wetland hydrology. Paired point with SP-32.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/1/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-37**

Investigator(s) Tanner Harris, Rhiannon Korhummel, WRA Section,Township,Range

Landform (hillslope, terrace, etc.) Hillslope Local Relief (concave, convex, none) Convex Slope(%) 10

Subregion(LRR) LRR C (Medit. CA) Lat: Long: Datum: WGS 84

Soil Map Unit Name Henneke-Montara-Rock outcrop complex, 15 to 50 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☐ Yes ☒ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point located in uplands adjacent to wetland seep on hillslope . Sample point does not meet criteria for hydrophytic vegetation, hydric soils or wetland hydrology. Paired point with SP-36.

Soil Map Unit Name Henneke-Montara-Rock outcrop complex, 15 to 50 percent slopes NWI classification

Are climatic/hydrologic conditions on-site typical for this time of year? ☐ Yes ☒ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☐ Yes ☒ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point is an upland sample point paired with wetland sample point SP-40. Sample point is located on a steep slope above and directly adjacent to a stream fringe wetland. Sample point does not meet criteria for hydrophytic vegetation, hydric soils or wetland hydrology. Rainfall was above average for time of year.

- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Oxidized Rhizospheres along Living Roots (C3) was observed. Also Saturation Visible on Aerial Imagery (C9) was observed.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/30/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-57**

Investigator(s) Tanner Harris, Russel Andrews, WRA Section,Township,Range

Landform (hillslope, terrace, etc.) valley floor Local Relief (concave, convex, none) None Slope(%) 2

Subregion(LRR) LRR C (Medit. CA) Lat: 38.753042 Long: -122.493433 Datum: WGS 84

Soil Map Unit Name Sobrante-Guenoc-Hambright complex, 15 to 30 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☐ Yes ☒ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☒ Yes ☐ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point located in upland adjacent to stream fringe wetland associated with a pernnial stream. Sample point does not meet wetland criteria for hydrophytic vegetation and wetland hydrology. Soils met Depleted Matrix (F3) hydric soil indicator. Paired with wetland sample point SP-56. Rainfall amounts were above average at time of site visit.

- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0-7

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Saturation (A3) was observed and therefore sample point meets wetland criteria for hydrology. No water table was observed, but assumed. Standing water in low flow channel 10 feet away from sample point. FAC-Neutral Test (D5) indicator is also met.

- ☒ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Dark serpentine parent material and/or high organic material may be masking redox. Soils assumed hydric based on dominance of hydrophytic vegetation and presence of primary indicators of wetland hydrology.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☒ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☒ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Sample point is located in a existing channel that shows evidence of flow. Surface Soil Cracks (B6) and Drainage Patterns (B10) hydrology indicators were observed.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/30/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-73**

Investigator(s) Aaron Arthur, Ra'am Akiba-Hajim Section,Township,Range

Landform (hillslope, terrace, etc.) toeslope Local Relief (concave, convex, none) None Slope(%) 2

Subregion(LRR) LRR C (Medit. CA) Lat: 38.749956 Long: -122.487379 Datum: WGS 84

Soil Map Unit Name Still loam, stratified substratum NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☐ Yes ☒ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☐ Yes ☒ No
Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point is located in along a channel side. Sample meets wetland criteria for hydrophytic vegetation, but does not meet wetland criteria for hydric soils and wetland hydrology. Paired with wetland sample point SP-72. Rainfall amounts were above average at time of site visit.

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☒ Yes ☐ No Depth (inches): 0.5

Water table present? ☐ Yes ☒ No Depth (inches):

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Primary indicators of Surface Water (A1) and Saturation (A3) were observed. Surface water was 0.5 inches deep and saturation was present at the surface. Secondary indicator FAC-Neutral Test (D5) was also met.

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Surface Soil Cracks (B6) and Biotic Crust (B12) were observed and therefore point meets wetland criteria for hydrology. FAC-Neutral Test (D5) indicator was also observed.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 6/1/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-93**

Investigator(s) Scott Yarger, Nathaniel Clark, WRA Section,Township,Range

Landform (hillslope, terrace, etc.) toeslope Local Relief (concave, convex, none) Convex Slope(%) 0-1

Subregion(LRR) LRR C (Medit. CA) Lat: 38.738019 Long: -122.458183 Datum: WGS 84

Soil Map Unit Name Sobrante-Guenoc-Hambright complex, 15 to 30 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☐ Yes ☒ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☒ Yes ☐ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point is located in an upland area adjacent to in-stream wetland. Sample does not meet wetland criteria for hydrophytic vegetation and wetland hydrology, however soils met Redox Dark Surface (F6) indicator. Paired with wetland sample point SP-92. Rainfall amounts above average at time of site visit.

- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0-12

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Saturation (A3) was observed and therefore sample point meets wetland criteria for hydrology. Soils were saturated to 12 inches below ground, but no water table was present below.

Type: _____

Depth (inches): _____

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Dark serpentine parent material may be masking redox. Soils assumed hydric based on dominance of hydrophytic vegetation and presence of primary indicators of wetland hydrology.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☒ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Sample point contains biotic crust (B12) and Saturation Visible on Aerial Imagery (C9).

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/30/2018

Applicant/Owner Lotusland Investment Holdings Inc. State CA Sampling Point **SP-105**

Investigator(s) Aaron Arthur, Ra'am Akiba-Hajim Section,Township,Range

Landform (hillslope, terrace, etc.) Hillslope Local Relief (concave, convex, none) Convex Slope(%) 1

Subregion(LRR) LRR C (Medit. CA) Lat: 38.726582 Long: -122.473881 Datum: WGS 84

Soil Map Unit Name Henneke-Montara-Rock outcrop complex, 15 to 50 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☐ Yes ☒ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☒ Yes ☐ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point is located along the edge of a wetland. Sample meets wetland criteria for hydric soils, but does not meet wetland criteria for hydrophytic vegetation and wetland hydrology. Paired with upland sample point SP-104. Rainfall amounts were above average at time of site visit.

- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: N/A

Depth (inches):

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Soil displays redox dark surface hydric soil indicator (F6).

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☒ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches):

Water table present? ☐ Yes ☒ No Depth (inches):

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches):

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Hydrology indicator Oxidized Rhizospheres Along Living Roots (C3) was present within this sample point.

Wetland Determination Data Form - Arid West Region

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☒ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☒ Yes ☐ No Depth (inches): 2

Water table present? ☐ Yes ☒ No Depth (inches): 0

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0-8

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Soil sample saturated to 8 inches in depth. Standing water observed in stream in sampled area. Sample point meets Surface Water (A1), wetland hydrology indicator.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 5/17/2018

Applicant/Owner Lotusland Investment Holdings, Inc. State CA Sampling Point **SP-113**

Investigator(s) Scott Yarger, Scott Batiuk, WRA, Inc. Section,Township,Range

Landform (hillslope, terrace, etc.) valley floor Local Relief (concave, convex, none) Convex Slope(%) 10

Subregion(LRR) LRR C (Medit. CA) Lat: 38.716602 Long: -122.464712 Datum: WGS 84

Soil Map Unit Name Sobrante-Hambright-Guenoc complex, 30 to 50 percent slopes NWI classification

Are climatic/hydrologic conditions on-site typical for this time of year? ☐ Yes ☒ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☐ Yes ☒ No

Hydric Soil Present? ☐ Yes ☒ No

Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point is an upland point paired with wetland point SP-112. Sample point is located on convex slope adjacent to and above a stream fringe wetland. Sample point does not meet criteria for hydrophytic vegetation, hydric soils or wetland hydrology. Rainfall was above average for time of year.

Type: _____

Depth (inches): _____

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Sample is assumed to have hydric soils due to strong hydric vegetation indications and saturation. Redox may be masked by red soils.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Two secondary indicators of Saturation Visible on Aerial Imagery (C9) and FAC-Neutral Test (D5) indicators were met. Saturation observed but no water table below.

Wetland Determination Data Form - Arid West Region

- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☒ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Dark serpentine parent material may be masking redox. Soils assumed hydric based on dominance of hydrophytic vegetation and presence of primary indicators of wetland hydrology.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☐ No Depth (inches): _____

Water table present? ☒ Yes ☐ No Depth (inches): 3

Saturation Present? (includes capillary fringe) ☐ Yes ☐ No Depth (inches): 0

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: High Water Table (A2) and Saturation (A3) were observed and therefore B208 meets wetland criteria for hydrology. The two secondary indicators of Saturation Visible on Aerial Imagery (C9) and FAC-Neutral Test (D5) were also met.

Wetland Determination Data Form - Arid West Region

- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☒ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: Heavy Clay

Depth (inches): 8

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Dark serpentine parent material may be masking redox. Soils assumed hydric based on dominance of perennial obligate vegetation and presence of primary indicators of wetland hydrology.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☒ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☒ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Sample point meets biotic crust (B12), Saturation Visible on Aerial Imagery (C9), and the FAC-Neutral test (D5)

Wetland Determination Data Form - Arid West Region

- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☒ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: Clay Shovel Refusal

Depth (inches): 10

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Dark serpentine parent material may be masking redox. Soils assumed hydric based on dominance of perennial obligate vegetation and presence of primary indicators of wetland hydrology.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☒ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Sample point contains biotic crust (B12) and meets FAC-neutral test (D5).

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 9/6/2018

Applicant/Owner Lotus Land Investment Holdings, Inc. State CA Sampling Point **SP-129**

Investigator(s) Tanner Harris, Rhiannon Korhummel, WRA, Inc. Section,Township,Range

Landform (hillslope, terrace, etc.) valley floor Local Relief (concave, convex, none) Concave Slope(%) 3

Subregion(LRR) LRR C (Medit. CA) Lat: 38.71726 Long: -122.516582 Datum: WGS 84

Soil Map Unit Name Maxwell clay loam, 0 to 2 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☒ Yes ☐ No
Wetland Hydrology Present? ☒ Yes ☐ No

Is the Sampled Area within a Wetland? ☒ **Yes** ☐ **No**

Remarks: Sample point located in a wetland swale. Sample point meets criteria for hydrophytic vegetation, hydric soils and wetland hydrology. Wetland boundary based on shift in vegetation and topography. Sample point paired with SP-130.

- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: N/A

Depth (inches): _____

Hydric Soil Present ? ☐ Yes ☒ No

Remarks: Hydric soil indicators were not observed within the sample point.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☐ Yes ☒ No

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: No indicators of hydrology were observed.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 9/7/2018

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: N/A

Depth (inches):

Hydric Soil Present ? ☐ Yes ☒ No

Remarks: Hydric soil indicators were not observed within the sample point.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches):

Water table present? ☐ Yes ☒ No Depth (inches):

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches):

Wetland Hydrology Present ? ☐ Yes ☒ No

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Wetland hydrology indicators were not observed within the sample point.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 9/7/2018

Applicant/Owner Lotus Land Investment Holdings, Inc. State CA Sampling Point **SP-137**

Investigator(s) Tanner Harris, Rhiannon Korhummel, WRA, Inc. Section,Township,Range

Landform (hillslope, terrace, etc.) valley floor Local Relief (concave, convex, none) Concave Slope(%) 3

Subregion(LRR) LRR C (Medit. CA) Lat: 38.71548 Long: -122.513649 Datum: WGS 84

Soil Map Unit Name Yorkville variant clay loam, 2 to 8 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☒ Yes ☐ No
Wetland Hydrology Present? ☒ Yes ☐ No

Is the Sampled Area within a Wetland? ☒ **Yes** ☐ **No**

Remarks: Sample point located in a marginal wetland swale feature with patchy upland/wetland vegetation. Wetland boundary based on shift in vegetation and topography. Sample point meets criteria for hydrophytic vegetation, hydric soils and wetland hydrology. Sample point paired with SP-138.

- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☐ **Yes** ☒ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: No indicators of hydrology observed.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 9/7/2018

Applicant/Owner Lotus Land Investment Holdings, Inc. State CA Sampling Point **SP-145**

Investigator(s) Gavin Albertoli, Scott Yarger, WRA, Inc. Section,Township,Range

Landform (hillslope, terrace, etc.) valley floor Local Relief (concave, convex, none) Concave Slope(%) 3

Subregion(LRR) LRR C (Medit. CA) Lat: 38.713365 Long: -122.509533 Datum: WGS 84

Soil Map Unit Name Maxwell clay loam, 2 to 8 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☒ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☒ Yes ☐ No
Wetland Hydrology Present? ☒ Yes ☐ No

Is the Sampled Area within a Wetland? ☒ **Yes** ☐ **No**

Remarks: Sample point taken in broad wetland swale. Wetland boundary delineated based on topography and vegetation. Sample point meets criteria for hydrophytic vegetation and wetland hydrology. Soils are problematic (serpentine) and assumed to by hydric. Sample point paired with SP-146.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City Unincorporated County Lake Sampling Date 8/28/2018

Applicant/Owner Lotus Land Investment Holdings, Inc. State CA Sampling Point **SP-149**

Investigator(s) Tanner Harris, Rhiannon Korhummel, WRA, Inc. Section,Township,Range

Landform (hillslope, terrace, etc.) Swale Local Relief (concave, convex, none) Concave Slope(%) 3

Subregion(LRR) LRR C (Medit. CA) Lat: 38.732011 Long: -122.540729 Datum: WGS 84

Soil Map Unit Name Jafa loam, 2 to 5 percent slopes NWI classification None

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☒ Yes ☐ No
Wetland Hydrology Present? ☒ Yes ☐ No

Is the Sampled Area within a Wetland? ☒ **Yes** ☐ **No**

Remarks: Sample point located in a marginal swale, paired with SP-150. Sample point meets criteria for hydrophytic vegetation, hydric soils and wetland hydrology. Wetland boundary based on shift in vegetation and topography.

- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: N/A

Depth (inches): _____

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Redox dark surface hydric soil indicator was observed within the sample point.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☒ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Surface water incidentally observed March through May 2018.Sample point meets Oxidized Rhizosphere along Living Roots (C3) and Saturation Visible on Aerial Imagery (C9).

Are climatic/hydrologic conditions on-site typical for this time of year? ☒ Yes ☐ No (If no, explain in remarks)

Are any of the following significantly disturbed? ☐ Vegetation ☐ Soil ☐ Hydrology Are "Normal Circumstances" present? ☒ Yes ☐ No

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☐ Yes ☒ No
Wetland Hydrology Present? ☐ Yes ☒ No

Is the Sampled Area within a Wetland? ☐ **Yes** ☒ **No**

Remarks: Sample point taken in FAC/FACW-dominated vernally mesic valley grassland. Sample point meets vegetation criteria but does not have hydric soils or wetland hydrology. Determined to be upland. No paired point.

Are any of the following naturally problematic? ☐ Vegetation ☐ Soil ☐ Hydrology (If needed, explain any answers in remarks)

SUMMARY OF FINDINGS - Attach site map showing sample point locations, transects, important features, etc.

Hydrophytic Vegetation Present? ☒ Yes ☐ No
Hydric Soil Present? ☒ Yes ☐ No
Wetland Hydrology Present? ☒ Yes ☐ No

Is the Sampled Area within a Wetland? ☒ **Yes** ☐ **No**

Remarks: Wetland swale in paleo channel. Boundary based on shift in vegetation and channel topography. Paired with SP-166.

- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: Cobble / rocks

Depth (inches): 10"

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Soils very dark. Distinct redox concentrations.

Meets hydric soil indicator F6

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☒ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☒ Yes ☐ No Depth (inches): 9-10

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0-9

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Deeper hoof prints relative to adjacent upland areas.

Meets primary hydrology indicators A2, A3, B13 and secondary hydrology indicator D5.

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: cobble

Depth (inches): 10"

Hydric Soil Present ? ☒ Yes ☐ No

Remarks: Meets F6.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☒ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☒ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☒ Yes ☐ No Depth (inches): 2

Water table present? ☒ Yes ☐ No Depth (inches): 9-10

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0-9

Wetland Hydrology Present ? ☒ Yes ☐ No

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Meets primary wetland hydrology indicators A1, A2, A3, A4 and secondary hydrology indicator D5. Standing water in microdepressions.

Hydrophytic Vegetation Indicators

☒ Dominance Test is >50%
☐ Prevalence Index is </= 3.0[1]
☐ Morphological adaptations (provide supporting data in remarks)
☐ Problematic hydrophytic vegetation[1] (explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present ? ☒ Yes ☐ No

Remarks: Meets Dominance Test indicator.

SOIL

Sampling Point SP-173

Profile description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	Matrix %	Redox Features Color (moist)	Redox Features %	Redox Features Type[1]	Redox Features Loc[1]	Texture	Remarks
0-16	N 2.5/-	100					Clay	

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix. [2]Location: PL=Pore Lining, RC=Root Channel, M=Matrix

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Stratified Layers (A5)(LRR C)
- ☐ 1cm Muck (A9)(LRR D)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☒ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: none

Depth (inches):

Hydric Soil Present ? ☒ Yes ☐ No

Remarks: Soils assumed hydric based on dominance of obligate wetland vegetation and primary hydrology indicators.

3-inch layer of organic matter on surface, suggestive of long-term inundation. Dark soils may be masking redox.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☒ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches):

Water table present? ☐ Yes ☒ No Depth (inches):

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches):

Wetland Hydrology Present ? ☒ Yes ☐ No

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Meets primary wetland hydrology indicator B12 and secondary indicator D5.

4+								restrictive layer rock

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix. [2]Location: PL=Pore Lining, RC=Root Channel, M=Matrix

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Stratified Layers (A5)(LRR C)
- ☐ 1cm Muck (A9)(LRR D)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☒ Loamy Mucky Mineral (F1)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: rock

Depth (inches): 4

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Meets hydric soil indicator F1.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☒ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☒ Yes ☐ No Depth (inches): 1-0

Water table present? ☒ Yes ☐ No Depth (inches): surface

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Meets primary wetland hydrology indicators A1, A2, and A3.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City _____ County Lake Sampling Date 5/7/2019

- ☐ 1cm Muck (A9)(LRR D)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☒ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: shovel refusal (clay & gravel)

Depth (inches): 4

Hydric Soil Present ? ☒ Yes ☐ No

Remarks: Shallow inundated area on compacted fill. Redoxomorphic features on surface, but not visible in profile. Soils assumed hydric based on hydrophytic vegetation and primary hydrology indicators being met.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☒ Surface Soil Cracks (B6)
- ☒ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☐ Yes ☒ No Depth (inches): _____

Water table present? ☐ Yes ☒ No Depth (inches): _____

Saturation Present? (includes capillary fringe) ☐ Yes ☒ No Depth (inches): _____

Wetland Hydrology Present ? ☒ Yes ☐ No

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Meets primary hydrology indicators B6 and B7 and secondary indicator D5.

- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☒ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: gravel

Depth (inches): 6

Hydric Soil Present ? ☒ **Yes** ☐ **No**

Remarks: Soils assumed hydric based on obligate and faculative wetland vegetation and primary hydrology indicators. Dark serpentine soils may be masking redox.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☒ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☒ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☒ Yes ☐ No Depth (inches): 2

Water table present? ☒ Yes ☐ No Depth (inches): 4-6

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0-4

Wetland Hydrology Present ? ☒ **Yes** ☐ **No**

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Meets primary hydrology indicators A1, A2, A3, and secondary hydrology indicators C9 and D5.

Wetland Determination Data Form - Arid West Region

- ☐ 1cm Muck (A9) (LRR C)
- ☐ 2cm Muck (A10)(LRR B)
- ☐ Reduced Vertic (F18)
- ☐ Red Parent Material (TF2)
- ☐ Other (explain in remarks)

[3]Indicators of hydric vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: none

Depth (inches):

Hydric Soil Present ? ☒ Yes ☐ No

Remarks: Meets hydric soil indicator F6.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- ☒ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)(Nonriverine)
- ☐ Sediment Deposits (B2)(Nonriverine)
- ☐ Drift Deposits (B3)(Nonriverine)
- ☐ Surface Soil Cracks (B6)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Water-Stained Leaves (B9)
- ☐ Salt Crust (B11)
- ☐ Biotic Crust (B12)
- ☐ Aquatic Invertebrates (B13)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres along Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in PLowed Soils (C6)
- ☐ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ☐ Water Marks (B1)(Riverine)
- ☐ Sediment Deposits (B2)(Riverine)
- ☐ Drift Deposits (B3)(Riverine)
- ☐ Drainage Patterns (B10)
- ☐ Dry-Season Water Table (C2)
- ☐ Thin Muck Surface (C7)
- ☐ Crayfish Burrows (C8)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Shallow Aquitard (D3)
- ☒ FAC-Neutral Test (D5)

Field Observations:

Surface water present? ☒ Yes ☐ No Depth (inches): 0

Water table present? ☒ Yes ☐ No Depth (inches): 0

Saturation Present? (includes capillary fringe) ☒ Yes ☐ No Depth (inches): 0

Wetland Hydrology Present ? ☒ Yes ☐ No

Describe recorded data (stream guage, monitoring well, aerial photos, etc.) if available.

Remarks: Meets primary hydrology indicators A1, A2, and A3 and secondary hydrology indicator D5.

Wetland Determination Data Form - Arid West Region

Project/Site Guenoc Valley Development City _____ County Lake Sampling Date 5/7/2019

APPENDIX E

PLANT SPECIES OBSERVED WITHIN THE STUDY AREA

DRAFT

DRAFT

Appendix E. List of Plant Species Observed within Guenoc Ranch

Surveys were conducted by WRA biologists between 2017 and 2019. Plant nomenclature follows Baldwin et al. (2012) and subsequent revisions by the Jepson Flora Project (2019).

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Acer macrophyllum	Bigleaf maple	native	tree	-	-	FAC	-
Achillea millefolium	Yarrow	native	perennial herb	-	-	FACU	-
Achyrachaena mollis	Blow wives	native	annual herb	-	-	FAC	-
Acmispon americanus var. *americanus*	Spanish lotus	native	annual herb	-	-	UPL	-
Acmispon brachycarpus	Short podded lotus	native	annual herb	-	-	-	-
Acmispon glaber var. *glaber*	Deerweed	native	perennial herb	-	-	-	-
Acmispon parviflorus	Hill lotus	native	annual herb	-	-	-	-
Acmispon wrangelianus	Chilean trefoil	native	annual herb	-	-	-	-
Adenostoma fasciculatum var. *fasciculatum*	Chamise	native	tree, shrub	-	-	-	-
Adiantum jordanii	California maidenhair fern	native	fern	-	-	FAC	-
Aegilops triuncialis	Goatgrass	non-native (invasive)	annual grass	-	High	-	-
Aesculus californica	Buckeye	native	tree	-	-	-	-
Agoseris grandiflora var. *grandiflora*	Giant mountain dandelion	native	perennial herb	-	-	-	-
Agoseris heterophylla var. *cryptopleura*	Mountain dandelion	native	annual herb	-	-	-	-
Agoseris heterophylla var. *heterophylla*	Annual agoseris	native	annual herb	-	-	-	-
Agrostis avenacea	Pacific bentgrass	non-native (invasive)	perennial grass	-	Limited	FACW	-
Agrostis stolonifera	Redtop	non-native (invasive)	perennial grass	-	Limited	FACW	-
Aira caryophyllea	Silvery hairgrass	non-native	annual grass	-	-	FACU	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Alisma lanceolatum	Water plantain	non-native	perennial herb (aquatic)	-	-	OBL	-
Allium amplectens	Narrow leaved onion	native	perennial herb (bulb)	-	-	-	2.3
Allium falcifolium	Sickle leaf onion	native	perennial herb (bulb)	-	-	-	4.2
Allium fimbriatum var. *fimbriatum*	Fringed onion	native	perennial herb (bulb)	-	-	-	-
Allium serra	Jeweled onion	native	perennial herb (bulb)	-	-	-	2.6
Alnus rhombifolia	White alder	native	tree	-	-	FACW	-
Alopecurus pratensis	Meadow foxtail	non-native	perennial grass	-	Watch	FACW	-
Amaranthus retroflexus	Rough pigweed	non-native	annual herb	-	-	FACU	-
Amsinckia intermedia	Common fiddleneck	native	annual herb	-	-	-	-
Amsinckia lycopsoides	Tarweed fiddleneck	native	annual herb	-	-	-	-
Amsinckia menziesii	Fiddleneck	native	annual herb	-	-	-	-
Amsinckia retrorsa	Rigid fiddleneck	native	annual herb	-	-	-	-
Ancistrocarphus filagineus	Woolly fishhooks	native	annual herb	-	-	-	3.3
Angelica californica	California angelica	native	perennial herb	-	-	-	-
Angelica tomentosa	Woolly angelica	native	perennial herb	-	-	-	2.7
Anisocarpus madioides	Woodland madia	native	perennial herb	-	-	-	-
Anthemis cotula	Dog fennel	non-native	annual herb	-	-	FACU	-
Antirrhinum vexillocalyculatum ssp. *vexillocalyculatum*	Wiry snapdragon	native	annual herb	-	-	-	-
Antirrhinum virga	Tall snapdragon	native	perennial herb	Rank 4.3	-	-	2.8
Aphanes occidentalis	Ladie's mantle	native	annual, perennial herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Apiastrum angustifolium	Wild celery	native	annual herb	-	-	UPL	1.5
Aphyllon fasciculatum	Clustered broomrape	native	perennial herb (parasitic)	-	-	-	-
Apocynum cannabinum	Indian hemp	native	perennial herb	-	-	FAC	-
Aquilegia eximia	Serpentine columbine	native	perennial herb	-	-	OBL	4.2
Arbutus menziesii	Madrone	native	tree	-	-	-	-
Arceuthobium campylopodum	Pine dwarf mistletoe	native	perennial herb (parasitic)	-	-	-	-
Arctostaphylos glandulosa ssp. *cushingiana*	Cushing manzanita	native	shrub	-	-	-	-
Arctostaphylos manzanita ssp. *elegans*	Konocti manzanita	native	shrub	Rank 1B.3	-	-	-
Arctostaphylos manzanita ssp. *manzanita*	Common manzanita	native	shrub	-	-	-	-
Arctostaphylos viscida ssp. *pulchella*	White leaf manzanita	native	tree, shrub	-	-	-	5
Arctostaphylos viscida ssp. *viscida*	Smooth white leaf manzanita	native	tree, shrub	-	-	-	2.2
Arnica discoidea	Rayless arnica	native	perennial herb	-	-	-	-
Artemisia douglasiana	California mugwort	native	perennial herb	-	-	FAC	-
Asclepias cordifolia	Purple milkweed	native	perennial herb	-	-	-	-
Asclepias eriocarpa	Indian milkweed	native	perennial herb	-	-	-	-
Asclepias fascicularis	Milkweed	native	perennial herb	-	-	FAC	-
Aspidotis densa	Lace fern	native	fern	-	-	-	3.4
Astragalus breweri	Brewer's milk vetch	native	annual herb	Rank 4.2	-	-	3.2
Astragalus clevelandii	Cleveland's milk vetch	native	perennial herb	Rank 4.3	-	FAC	6.1
Astragalus gambelianus	Gambel's dwarf milk vetch	native	annual herb	-	-	-	-
Astragalus rattanii var. *jepsonianus*	Jepson's milk vetch	native	annual herb	Rank 1B.2	-	-	4.3

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Athyrium filix-femina var. *cyclosorum*	Western lady fern	native	fern	-	-	FAC	-
Athysanus pusillus	Dwarf athysanus	native	annual herb	-	-	-	-
Avena barbata	Slim oat	non-native (invasive)	annual, perennial grass	-	Moderate	-	-
Avena fatua	Wildoats	non-native (invasive)	annual grass	-	Moderate	-	-
Baccharis pilularis ssp. *consanguinea*	Coyote brush	native	shrub	-	-	-	-
Baccharis salicifolia ssp. *salicifolia*	Mule fat	native	shrub	-	-	FAC	-
Balsamorhiza macrolepis	Big scale balsam root	native	perennial herb	Rank 1B.2	-	-	-
Barbarea vulgaris	Yellow rocket	non-native	perennial herb	-	-	FAC	-
Bellardia trixago	Mediterranean lineseed	non-native (invasive)	annual herb	-	Limited	-	-
Brickellia californica	California brickellia	native	perennial herb	-	-	FACU	-
Briza maxima	Rattlesnake grass	non-native (invasive)	annual grass	-	Limited	-	-
Briza minor	Little rattlesnake grass	non-native	annual grass	-	-	FAC	-
Brodiaea elegans ssp. *elegans*	Harvest brodiaea	native	perennial herb	-	-	FACU	-
Brodiaea leptandra	Narrow-anthered brodiaea	native	perennial herb	Rank 1B.2	-	-	-
Bromus carinatus var. *carinatus*	California brome	native	perennial grass	-	-	-	-
Bromus diandrus	Ripgut brome	non-native (invasive)	annual grass	-	Moderate	-	-
Bromus hordeaceus	Soft chess	non-native (invasive)	annual grass	-	Limited	FACU	-
Bromus laevipes	Narrow flowered brome	native	annual, perennial grass	-	-	-	1.7

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Bromus madritensis ssp. *madritensis*	Foxtail chess	non-native	annual grass	-	-	UPL	-
Bromus madritensis ssp. *rubens*	Foxtail brome	non-native (invasive)	annual grass	-	High	UPL	-
Calandrinia menziesii	Red maids	native	annual herb	-	-	FACU	-
Callitriche heterophylla var. *bolanderi*	Bolander's water starwort	native	annual herb	-	-	OBL	-
Calochortus amabilis	Golden fairy lantern	native	perennial herb	-	-	-	-
Calochortus luteus	Yellow mariposa	native	perennial herb	-	-	-	-
Calochortus splendens	Splendid mariposa	native	perennial herb	-	-	-	-
Calochortus tolmiei	Hairy star tulip	native	perennial herb	-	-	-	-
Calochortus uniflorus	Large flowered star tulip	native	perennial herb	Rank 4.2	-	FACW	1.7
Calochortus vestae	Yellow mariposa	native	perennial herb	-	-	-	2
Calycadenia fremontii	Fremont's calycadenia	native	annual herb	-	-	-	-
Calycadenia pauciflora	Small flowered calycadenia	native	annual herb	-	-	-	5.3
Calycanthus occidentalis	Spicebush	native	shrub	-	-	FAC	-
Calystegia collina ssp. *collina*	Hillside morning glory	native	perennial herb	-	-	-	4.7
Calystegia collina ssp. *oxyphylla*	Mt. Saint Helena morning glory	native	perennial herb (rhizomatous)	Rank 4.2	-	-	5.6
Calystegia occidentalis ssp. *occidentalis*	Modoc morning glory	native	perennial herb	-	-	-	-
Calystegia purpurata ssp. *purpurata*	Smooth western morning glory	native	perennial herb	-	-	-	-
Camissoniopsis intermedia	Intermediate sun cups	native	annual herb	-	-	-	-
Campanula angustiflora	Eastwood's harebell	native	annual herb	-	-	-	3.9
Capsella bursa-pastoris	Shepherd's purse	non-native	annual herb	-	-	FACU	-
Cardamine hirsuta	Hairy bitter cress	non-native	annual herb	-	-	FACU	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Cardamine oligosperma	Idaho bittercress	native	annual, perennial herb	-	-	FAC	-
Carduus pycnocephalus ssp. *pycnocephalus*	Italian thistle	non-native (invasive)	annual herb	-	Moderate	-	-
Carex barbarae	Valley sedge	native	perennial grasslike herb	-	-	FAC	-
Carex densa	Dense sedge	native	perennial grasslike herb	-	-	OBL	-
Carex multicaulis	Forest sedge	native	perennial grasslike herb	-	-	-	-
Carex nudata	Torrent sedge	native	perennial grasslike herb	-	-	FACW	-
Carex pellita	Woolly sedge	native	perennial grasslike herb	-	-	OBL	-
Carex praegracilis	Field sedge	native	perennial grasslike herb	-	-	FACW	-
Carex serratodens	Bifid sedge	native	perennial grasslike herb	-	-	FACW	4.9
Carex tumulicola	Split awn sedge	native	perennial grasslike herb	-	-	FACU	-
Castilleja affinis ssp. *affinis*	Coast Indian paint brush	native	perennial herb	-	-	-	-
Castilleja applegatei ssp. *martinii*	Martin's paintbrush	native	perennial herb	-	-	-	-
Castilleja attenuata	Narrow leaved owl's clover	native	annual herb	-	-	-	-
Castilleja densiflora ssp. *densiflora*	Dense flower owl's clover	native	annual herb	-	-	-	-
Castilleja exserta ssp. *exserta*	Purple owl's clover	native	annual herb	-	-	-	-
Castilleja foliolosa	Texas paintbrush	native	perennial herb	-	-	-	2.3
Castilleja minor	Little paintbrush	native	annual herb	-	-	OBL	-
Castilleja rubicundula ssp. *lithospermoides*	Cream sacs	native	annual herb	-	-	-	2.4
Caulanthus lasiophyllus	California mustard	native	annual herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Ceanothus cuneatus var. *cuneatus*	Buck brush	native	shrub	-	-	-	1.5
Ceanothus foliosus var. *foliosus*	Wavy leaved ceanothus	native	shrub	-	-	-	-
Ceanothus integerrimus var. *macrothyrsus*	Deerbrush	native	shrub	-	-	-	-
Ceanothus jepsonii	Musk brush	native	shrub	-	-	-	6
Centaurea calcitrapa	Purple star thistle	non-native (invasive)	annual, perennial herb	-	Moderate	-	-
Centaurea melitensis	Tocalote	non-native (invasive)	annual herb	-	Moderate	-	-
Centaurea solstitialis	Yellow starthistle	non-native (invasive)	annual herb	-	High	-	-
Centromadia fitchii	Spikeweed	native	annual herb	-	-	FACU	-
Cephalanthus occidentalis	Common buttonbush	native	shrub	-	-	OBL	-
Cerastium glomeratum	Large mouse ears	non-native	annual herb	-	-	UPL	-
Cercis occidentalis	Western redbud	native	tree, shrub	-	-	-	-
Cercocarpus betuloides var. *betuloides*	Birch leaf mountain mahogany	native	tree, shrub	-	-	-	-
Chaenactis glabriuscula var. *heterocarpha*	Variable fruited yellow chaenactis	native	annual herb	-	-	-	2.5
Chenopodium album	Lambs quarters	non-native	annual herb	-	-	FACU	-
Chlorogalum pomeridianum var. *pomeridianum*	Common soaproot	native	perennial herb	-	-	-	-
Chorizanthe membranacea	Pink spineflower	native	annual herb	-	-	-	-
Chorizanthe polygonoides var. *polygonoides*	Knotweed spineflower	native	annual herb	-	-	-	-
Cichorium intybus	Chicory	non-native	perennial herb	-	-	FACU	-
Cirsium cymosum var. *cymosum*	Peregrine thistle	native	perennial herb	-	-	-	-
Cirsium douglasii	Swamp thistle	native	perennial herb	-	-	OBL	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Cirsium occidentale var. *venustum*	Coulter's thistle	native	perennial herb	-	-	-	-
Cirsium vulgare	Bullthistle	non-native (invasive)	perennial herb	-	Moderate	FACU	-
Clarkia amoena ssp. *huntiana*	Farewell to spring	native	annual herb	-	-	-	-
Clarkia concinna ssp. *concinna*	Red ribbons	native	annual herb	-	-	-	-
Clarkia gracilis ssp. *tracyi*	Tracy's clarkia	native	annual herb	Rank 4.2	-	-	5
Clarkia purpurea ssp. *quadrivulnera*	Purple clarkia	native	annual herb	-	-	-	-
Clarkia rhomboidea	Tongue clarkia	native	annual herb	-	-	-	-
Clarkia unguiculata	Woodland clarkia	native	annual herb	-	-	-	-
Claytonia exigua ssp. *exigua*	Serpentine springbeauty	native	annual herb	-	-	-	3.4
Claytonia parviflora ssp. *parviflora*	Miner'slettuce	native	annual herb	-	-	FACU	-
Claytonia perfoliata ssp. *perfoliata*	Miner's lettuce	native	annual herb	-	-	FAC	-
Clematis lasiantha	Pipestem	native	perennial herb, vine	-	-	-	-
Clematis ligusticifolia	Creek clematis	native	perennial herb, vine	-	-	FAC	-
Collinsia greenei	Greene's collinsia	native	annual herb	-	-	-	5.2
Collinsia heterophylla var. *heterophylla*	Purple chinese houses	native	annual herb	-	-	-	-
Collinsia sparsiflora var. *sparsiflora*	Few flowered collinsia	native	annual herb	-	-	-	-
Collomia diversifolia	Serpentine collomia	native	annual herb	Rank 4.3	-	-	5.6
Collomia heterophylla	Varied leaved collomia	native	annual herb	-	-	-	-
Convolvulus arvensis	Field bindweed	non-native	perennial herb, vine	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Cordylanthus pilosus ssp. *pilosus*	Hairy bird's beak	native	annual herb	-	-	-	-
Cordylanthus tenuis ssp. *brunneus*	Serpentine bird's beak	native	annual herb (hemiparasitic)	Rank 4.3	-	-	5.1
Cornus nuttallii	Mountain dogwood	native	shrub	-	-	FACU	-
Cornus sericea ssp. *occidentalis*	Western dogwood	native	shrub	-	-	FACW	-
Crassula aquatica	Aquatic pygmy weed	native	annual herb	-	-	OBL	-
Crassula connata	Sand pygmy weed	native	annual herb	-	-	FAC	-
Crassula tillaea	Mediterranean pygmy weed	non-native	annual herb	-	-	FACU	-
Crocanthemum scoparium	Peak rush-rose	native	shrub	-	-	-	-
Croton setiger	Turkey-mullein	native	perennial herb	-	-	-	-
Crypsis sp.	Prickle grass	non-native	annual grass	-	-	FACW-OBL-	-
Cryptantha flaccida	Beaked cryptantha	native	annual herb	-	-	-	1.6
Cryptantha hispidula	Napa cryptantha	native	annual herb	-	-	-	6
Cuscuta brachycalyx	San joaquin dodder	native	annual herb, vine (parasitic)	-	-	-	-
Cynodon dactylon	Bermuda grass	non-native (invasive)	perennial grass	-	Moderate	FACU	-
Cynoglossum grande	Houndstongue	native	perennial herb	-	-	-	-
Cynosurus echinatus	Dogtail grass	non-native (invasive)	annual grass	-	Moderate	-	-
Cyperus eragrostis	Tall cyperus	native	perennial grasslike herb	-	-	FACW	-
Cytisus scoparius	Scotch broom	non-native (invasive)	shrub	-	High	-	-
Dactylis glomerata	Orchardgrass	non-native (invasive)	perennial grass	-	Limited	FACU	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Damasonium californicum	California damsonium	native	perennial herb (aquatic)	-	-	OBL	-
Danthonia californica	California oatgrass	native	perennial grass	-	-	FAC	-
Datisca glomerata	Durango root	native	perennial herb	-	-	FACW	-
Datura stramonium	Jimson weed	non-native	annual herb	-	-	-	-
Daucus pusillus	Wild carrot	native	annual herb	-	-	-	-
Delphinium hesperium ssp. *pallescens*	Western larkspur	native	perennial herb	-	-	FAC	-
Delphinium nudicaule	Canyon larkspur	native	perennial herb	-	-	-	-
Delphinium uliginosum	Swamp larkspur	native	perennial herb	Rank 4.2	-	OBL	5.7
Delphinium variegatum ssp. *variegatum*	Royal larkspur	native	perennial herb	-	-	-	-
Dendromecon rigida	Bush poppy	native	shrub	-	-	-	-
Deschampsia cespitosa ssp. *cespitosa*	Tufted hairgrass	native	perennial grass	-	-	FACW	-
Deschampsia danthonioides	Annual hairgrass	native	annual grass	-	-	FACW	-
Dichelostemma capitatum ssp. *capitatum*	Wild hyacinth	native	perennial herb	-	-	FACU	-
Dichelostemma congestum	Fork toothed ookow	native	perennial herb	-	-	-	-
Digitaria sanguinalis	Crabgrass	non-native	annual grass	-	-	FACU	-
Diplacus aurantiacus	Sticky monkeyflower	native	shrub	-	-	FACU	-
Diplacus congdonii	Congdon's monkeyflower	native	annual herb	-	-	FAC	-
Diplacus douglasii	Purple mouse ears	native	annual herb	-	-	FACW	2.7
Diplacus kelloggii	Kellogg's monkeyflower	native	annual herb	-	-	-	-
Diplacus tricolor	Tricolor monkeyflower	native	annual herb	-	-	OBL	-
Downingia concolor var. *concolor*	Spotted throat downingia	native	annual herb	-	-	OBL	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Downingia cuspidata	Toothed downingia	native	annual herb	-	-	OBL	-
Drymocallis glandulosa	Sticky cinquefoil	native	perennial herb	-	-	FAC	-
Dryopteris arguta	Wood fern	native	fern	-	-	-	-
Dudleya cymosa ssp. *cymosa*	Canyon dudleya	native	perennial herb	-	-	-	-
Echinochloa crus-galli	Barnyard grass	non-native	annual grass	-	-	FACW	-
Ehrendorferia chrysantha	Golden eardrops	native	perennial herb	-	-	-	1.1
Eleocharis acicularis	Needle spikerush	native	perennial grasslike herb	-	-	OBL	-
Eleocharis macrostachya	Spike rush	native	perennial grasslike herb	-	-	OBL	-
Elymus caput-medusae	Medusa head	non-native (invasive)	annual grass	-	High	-	-
Elymus elymoides var. *elymoides*	Squirrel tail grass	native	perennial grass	-	-	FACU	-
Elymus glaucus ssp. *glaucus*	Blue wild rye	native	perennial grass	-	-	FACU	-
Elymus multisetus	Big squirreltail grass	native	perennial grass	-	-	-	-
Elymus triticoides	Beardless wild rye	native	perennial grass	-	-	FAC	-
Epilobium brachycarpum	Willow herb	native	annual herb	-	-	-	-
Epilobium campestre	Smooth boisduvalia	native	annual herb	-	-	OBL	-
Epilobium canum ssp. *canum*	California fuchsia	native	perennial herb	-	-	-	-
Epilobium ciliatum	Slender willow herb	native	perennial herb	-	-	FACW	-
Epilobium densiflorum	Willow herb	native	annual herb	-	-	FACW	-
Epilobium minutum	Minute willowherb	native	annual herb	-	-	FACU	2
Epilobium torreyi	Narrow boisduvalia	native	annual herb	-	-	FACW	-
Epipactis gigantea	Stream orchid	native	perennial herb	-	-	OBL	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Equisetum hyemale ssp. *affine*	Giant scouring rush	native	fern	-	-	FACW	-
Equisetum laevigatum	Smooth scouring rush	native	fern	-	-	FACW	-
Ericameria arborescens	Golden fleece	native	shrub	-	-	-	1.3
Erigeron canadensis	Canada horseweed	native	annual herb	-	-	FACU	-
Erigeron greenei	Greene's narrow-leaved daisy	native	perennial herb	Rank 1B.2	-	-	-
Erigeron philadelphicus var. *philadelphicus*	Philadelphia fleabane	native	perennial herb	-	-	FACU	-
Eriodictyon californicum	Yerba santa	native	shrub	-	-	-	-
Eriogonum luteolum var. *luteolum*	Golden buckwheat	native	annual herb	-	-	-	3.8
Eriogonum nudum var. *nudum*	Nude buckwheat	native	shrub	-	-	-	-
Eriophyllum lanatum var. *achilleoides*	Yarrow leaved woolly sunflower	native	perennial herb	-	-	-	-
Erodium botrys	Big heron bill	non-native	annual herb	-	-	FACU	-
Erodium brachycarpum	White stemmed filaree	non-native	annual herb	-	-	-	-
Erodium cicutarium	Red stemmed filaree	non-native (invasive)	annual herb	-	Limited	-	-
Erodium moschatum	Whitestem filaree	non-native	annual herb	-	-	-	-
Eryngium aristulatum var. *aristulatum*	Jepson's button celery	native	perennial herb	-	-	OBL	-
Erythranthe guttata	Seep monkeyflower	native	perennial herb (rhizomatous)	-	-	OBL	-
Erythranthe latidens	Broad toothed monkeyflower	native	annual herb	-	-	OBL	-
Erythranthe microphylla	Seep monkeyflower	native	annual herb	-	-	OBL	-
Erythranthe nudata	Bare monkeyflower	native	annual herb	Rank 4.3	-	OBL	5.6
Erythronium helenae	St. Helena fawn lily	native	perennial herb (bulb)	Rank 4.2	-	-	4.5
Eschscholzia caespitosa	Tufted poppy	native	annual herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Eschscholzia californica	California poppy	native	annual, perennial herb	-	-	-	-
Eucalyptus camaldulensis	Red gum	non-native (invasive)	tree	-	Limited	FAC	-
Euphorbia serpyllifolia	Thyme-leaved spurge	native	annual herb	-	-	-	-
Euphorbia spathulata	Reticulate seeded spurge	native	annual herb	-	-	FAC	-
Eurybia radulina	Roughleaf aster	native	perennial herb				
Euthamia occidentalis	Western goldenrod	native	perennial herb	-	-	FACW	-
Festuca arundinacea	Reed fescue	non-native (invasive)	perennial grass	-	Moderate	FACU	-
Festuca bromoides	Brome fescue	non-native	annual grass	-	-	FACU	-
Festuca californica	California fescue	native	perennial grass	-	-	FACU	2.4
Festuca idahoensis	Blue fescue	native	perennial grass	-	-	FACU	1.3
Festuca microstachys	Small fescue	native	annual grass	-	-	-	-
Festuca myuros	Rattail sixweeks grass	non-native (invasive)	annual grass	-	Moderate	FACU	-
Festuca perennis	Italian rye grass	non-native (invasive)	annual, perennial grass	-	Moderate	FAC	-
Ficus carica	Common fig	non-native (invasive)	tree	-	Moderate	FACU	-
Frangula californica ssp. *tomentella*	Hoary coffeeberry	native	shrub	-	-	-	1.5
Fraxinus dipetala	Two petaled ash	native	tree, shrub	-	-	-	-
Fraxinus latifolia	Oregon ash	native	tree	-	-	FACW	-
Fritillaria affinis	Checker lily	native	perennial herb (bulb)	-	-	-	2
Fritillaria purdyi	Purdy's fritillary	native	perennial herb (bulb)	Rank 4.3	-	-	4.5

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Fritillaria recurva	Scarlet fritillary	native	perennial herb	-	-	-	-
Galium andrewsii ssp. *andrewsii*	Phlox leaved bedstraw	native	perennial herb	-	-	-	3.2
Galium aparine	Cleavers	native	annual herb	-	-	FACU	-
Galium bolanderi	Bolander's bedstraw	native	perennial herb	-	-	-	-
Galium californicum	California bedstraw	native	perennial herb	-	-	-	-
Galium murale	Tiny bedstraw	non-native	annual herb	-	-	-	-
Galium parisiense	Wall bedstraw	non-native	annual herb	-	-	UPL	-
Galium porrigens var. *porrigens*	Graceful bedstraw	native	vine, shrub	-	-	-	-
Galium porrigens var. *tenue*	Graceful bedstraw	native	vine, shrub	-	-	-	-
Garrya congdonii	Silk tassel	native	shrub	-	-	-	5
Gastridium phleoides	Nit grass	non-native	annual grass	-	-	FACU	-
Genista monspessulana	French broom	non-native (invasive)	shrub	-	High	-	-
Geranium dissectum	Wild geranium	non-native (invasive)	annual herb	-	Limited	-	-
Geranium molle	Crane's bill geranium	non-native	annual, perennial herb	-	-	-	-
Gilia capitata ssp. *capitata*	Blue field gilia	native	annual herb	-	-	-	1.6
Gilia clivorum	Purple spot gilia	native	annual herb	-	-	-	-
Gilia tricolor ssp. *diffusa*	Bird's eyes	native	annual herb	-	-	-	-
Githopsis specularioides	Venus' looking glass	native	annual herb	-	-	FACU	-
Glyceria declinata	Waxy mannagrass	non-native (invasive)	perennial grass	-	Moderate	FACW	-
Glycyrrhiza glabra	Licorice	non-native	perennial herb	-	-	-	-
Glycyrrhiza lepidota	American licorice	native	perennial herb	-	-	FAC	-
Gnaphalium palustre	Lowland cudweed	native	annual herb	-	-	FACW	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Gratiola ebracteata	Common hedge hyssop	native	annual herb	-	-	OBL	-
Grindelia hirsutula	Gumweed	native	perennial herb	-	-	FACW	1.4
Helenium bigelovii	Bigelow's sneezeweed	native	perennial herb	-	-	FACW	2.9
Helenium puberulum	Sneezeweed	native	perennial herb	-	-	FACW	-
Helianthella californica var. *californica*	California helianthella	native	perennial herb	-	-	-	-
Helianthus exilis	Serpentine sunflower	native	annual herb	Rank 4.2	-	FACU	5.7
Heliotropium curassavicum var. *oculatum*	Seaside heliotrope	native	perennial herb	-	-	FACU	-
Helminthotheca echioides	Bristly ox-tongue	non-native (invasive)	annual, perennial herb	-	Limited	FAC	-
Hemizonia congesta ssp. *clevelandii*	Cleveland's tarweed	native	annual herb	-	-	-	-
Hesperevax sparsiflora var. *sparsiflora*	Few flowered evax	native	annual herb	-	-	FACU	1.8
Hesperocyparis sargentii	Sargent cypress	native	tree, shrub	-	-	-	4.9
Hesperolinon bicarpellatum	Two carpellate western flax	native	annual herb	Rank 1B.2	-	-	6.2
Hesperolinon californicum	California western flax	native	annual herb	-	-	-	2.8
Hesperolinon didymocarpum	Lake County western flax	native	annual herb	SE, Rank 1B.2	-	-	6.2
Hesperolinon disjunctum	Coast range western flax	native	annual herb	-	-	-	6
Hesperolinon micranthum	Small flower western flax	native	annual herb	-	-	-	2.4
Hesperolinon spergulinum	Slender western flax	native	annual herb	-	-	-	4.7
Heterocodon rariflorum	Heterocodon	native	annual herb	-	-	FACW	-
Heteromeles arbutifolia	Toyon	native	shrub	-	-	-	-
Heterotheca oregona	Oregon golden aster	native	perennial herb	-	-	FACU	-
Hirschfeldia incana	Short-podded mustard	non-native (invasive)	perennial herb	-	Moderate	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Hoita macrostachya	California hemp	native	perennial herb	-	-	OBL	-
Holocarpha virgata ssp. *virgata*	Narrow tarplant	native	annual herb	-	-	-	-
Hordeum brachyantherum ssp. *brachyantherum*	Meadow barley	native	perennial grass	-	-	FACW	-
Hordeum brachyantherum ssp. *californicum*	Meadow barley	native	perennial grass	-	-	FACW	3.1
Hordeum marinum ssp. *gussoneanum*	Mediterranean barley	non-native (invasive)	annual grass	-	Moderate	FAC	-
Hordeum murinum ssp. *glaucum*	Foxtail	non-native (invasive)	annual grass	-	Moderate	FACU	-
Hordeum murinum ssp. *leporinum*	Farmer's foxtail	non-native (invasive)	annual grass	-	Moderate	FACU	-
Hypericum concinnum	Gold wire	native	perennial herb	-	-	-	-
Hypericum perforatum ssp. *perforatum*	Klamathweed	non-native	perennial herb	-	Moderate	FACU	-
Hypochaeris glabra	Smooth cats ear	non-native (invasive)	annual herb	-	Limited	-	-
Hypochaeris radicata	Hairy cats ear	non-native (invasive)	perennial herb	-	Moderate	FACU	-
Iris fernaldii	Fernald's iris	native	perennial herb	-	-	-	-
Iris macrosiphon	Ground iris	native	perennial herb	-	-	-	1.1
Juglans hindsii	Northern California black walnut	native	tree	Rank 1B.1	-	FAC	-
Juncus balticus ssp. *ater*	Baltic rush	native	perennial grasslike herb	-	-	FACW	-
Juncus bufonius	Common toad rush	native	annual grasslike herb	-	-	FACW	-
Juncus effusus ssp. *pacificus*	Pacific rush	native	perennial grasslike herb	-	-	FACW	-
Juncus mexicanus	Mexican rush	native	perennial grasslike herb	-	-	FACW	-
Juncus occidentalis	Western rush	native	perennial grasslike herb	-	-	FACW	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Juncus patens	Common rush	native	perennial grasslike herb	-	-	FACW	-
Juncus phaeocephalus var. *phaeocephalus*	Brown headed rush	native	perennial grasslike herb	-	-	FACW	-
Juncus tenuis	Slender rush	native	perennial grasslike herb	-	-	FACW	-
Juncus xiphioides	Iris leaved rush	native	perennial grasslike herb	-	-	OBL	-
Keckiella breviflora var. *glabrisepala*	Hairless gaping keckiella	native	shrub	-	-	-	-
Kickxia elatine	Sharp point fluellin	non-native	perennial herb	-	-	UPL	-
Koeleria macrantha	June grass	native	perennial grass	-	-	-	-
Lactuca saligna	Willow lettuce	non-native	annual herb	-	-	UPL	-
Lactuca serriola	Prickly lettuce	non-native	annual herb	-	-	FACU	-
Lagophylla minor	Little hareleaf	native	annual herb	-	-	-	4.7
Lagophylla ramosissima	Common hareleaf	native	annual herb	-	-	-	-
Lamium amplexicaule	Henbit	non-native	annual herb	-	-	-	-
Lasthenia californica ssp. *californica*	California goldfields	native	annual herb	-	-	FACU	-
Lasthenia glaberrima	Smooth goldfields	native	annual herb	-	-	OBL	-
Lasthenia glabrata ssp. *glabrata*	Yellow rayed goldfields	native	annual herb	-	-	FACW	-
Lasthenia gracilis	Needle goldfields	native	annual herb	-	-	-	-
Lathyrus cicera	Red peavine	non-native	annual herb	-	-	-	-
Lathyrus hirsutus	Caley pea	non-native	annual herb	-	-	FAC	-
Lathyrus tingitanus	Tangier pea	non-native	annual herb	-	-	-	-
Lathyrus vestitus var. *vestitus*	Hillside pea	native	perennial herb	-	-	-	1.8
Layia chrysanthemoides	Smooth tidy tips	native	annual herb	-	-	FACW	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Layia septentrionalis	Colusa layia	native	annual herb	Rank 1B.2	-	-	3.2
Leontodon saxatilis ssp. *longirostris*	Hawkbit	non-native	annual herb	-	-	FACU	-
Lepechinia calycina	Pitcher sage	native	shrub	-	-	-	-
Lepidium latifolium	Perennial pepperweed	non-native (invasive)	perennial herb	-	High	FAC	-
Lepidium nitidum	Shining pepper grass	native	annual herb	-	-	FAC	-
Lepidium strictum	Peppergrass	native	annual herb	-	-	-	-
Leptosiphon bicolor	True babystars	native	annual herb	-	-	UPL	-
Leptosiphon ciliatus	Whiskerbrush	native	annual herb	-	-	-	-
Leptosiphon parviflorus	Variable linanthus	native	annual herb	-	-	-	-
Lessingia ramulosa	Sonoma lessingia	native	annual herb	-	-	-	5.4
Lewisia rediviva var. *rediviva*	Bitter root	native	perennial herb	-	-	-	-
Limnanthes douglasii ssp. *nivea*	Douglas' meadowfoam	native	annual herb	-	-	OBL	-
Linanthus dichotomus ssp. *meridianus*	Evening snow	native	annual herb	-	-	-	-
Lithophragma affine	Common woodland star	native	perennial herb	-	-	-	-
Lithophragma heterophyllum	Woodland star	native	perennial herb	-	-	-	-
Logfia filaginoides	California cottonrose	native	annual herb	-	-	-	-
Logfia gallica	Narrowleaf cottonrose	non-native	annual herb	-	-	-	-
Lomatium californicum	Celery weed	native	perennial herb	-	-	-	-
Lomatium dasycarpum ssp. *tomentosum*	Woolly fruited lomatium	native	perennial herb	-	-	-	-
Lomatium hooveri	Hoover's lomatium	native	perennial herb	Rank 4.3	-	-	5.9
Lomatium marginatum var. *marginatum*	Hartweg's lomatium	native	perennial herb	-	-	-	-
Lomatium marginatum var. *purpureum*	Jepson's lomatium	native	perennial herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Lomatium utriculatum	Hog fennel	native	perennial herb	-	-	-	1.7
Lonicera hispidula	Pink honeysuckle	native	vine, shrub	-	-	FACU	-
Lonicera interrupta	Chaparral honeysuckle	native	vine, shrub	-	-	-	-
Lotus corniculatus	Bird's foot trefoil	non-native	perennial herb	-	-	FAC	-
Lotus tenuis	Narrow-leaf bird’s foot trefoil	non-native	perennial herb	-	-	FACU	-
Lupinus albifrons var. *albifrons*	Silver bush lupine	native	shrub	-	-	-	-
Lupinus albifrons var. *collinus*	Silver bush lupine	native	shrub	-	-	-	-
Lupinus bicolor	Miniature lupine	native	annual, perennial herb	-	-	-	-
Lupinus latifolius var. *latifolius*	Broad leaf lupine	native	perennial herb	-	-	FACW	-
Lupinus microcarpus var. *densiflorus*	Dense-flowered chick lupine	native	annual herb	-	-	-	-
Lupinus microcarpus var. *microcarpus*	Chick lupine	native	annual herb	-	-	-	-
Lupinus nanus	Sky lupine	native	annual herb	-	-	-	-
Lupinus succulentus	Arroyo lupine	native	annual herb	-	-	-	-
Luzula comosa var. *comosa*	Hairy wood rush	native	perennial grasslike herb	-	-	FAC	-
Lysimachia arvensis	Scarlet pimpernel	non-native	annual herb	-	-	FAC	-
Lysimachia latifolia	Pacific starflower	native	perennial herb	-	-	FAC	-
Lythrum hyssopifolia	Hyssop loosestrife	non-native (invasive)	annual, perennial herb	-	Limited	OBL	-
Madia elegans	Common madia	native	annual herb	-	-	-	-
Madia exigua	Small tarweed	native	annual herb	-	-	-	1.8
Madia gracilis	Gumweed	native	annual herb	-	-	-	-
Malacothrix floccifera	Woolly malacothrix	native	annual herb	-	-	-	2.1
Malva nicaeensis	Bull mallow	non-native	annual herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Malva parviflora	Cheeseweed	non-native	annual herb	-	-	-	-
Malvella leprosa	Alkali mallow	native	perennial herb	-	-	FACU	-
Marah watsonii	Watson's wild cucumber	native	perennial herb, vine	-	-	-	-
Marrubium vulgare	White horehound	non-native (invasive)	perennial herb	-	Limited	FACU	-
Marsilea vestita ssp. *vestita*	Hairy pepperwort	native	fern	-	-	OBL	-
Matricaria discoidea	Pineapple weed	native	annual herb	-	-	FACU	-
Medicago polymorpha	California burclover	non-native (invasive)	annual herb	-	Limited	FACU	-
Melica californica	California melic	native	perennial grass	-	-	-	-
Melica torreyana	Torrey's melica	native	perennial grass	-	-	-	-
Melilotus albus	White sweetclover	non-native	annual, biennial herb	-	-	-	-
Melilotus indicus	Annual yellow sweetclover	non-native	annual herb	-	-	FACU	-
Mentha pulegium	Pennyroyal	non-native (invasive)	perennial herb	-	Moderate	OBL	-
Micranthes integrifolia	Smooth leaf saxifrage	native	perennial herb	-	-	FACW	-
Micropus californicus var. *californicus*	Slender cottonweed	native	annual herb	-	-	FACU	-
Microseris douglasii ssp. *douglasii*	Douglas' microseris	native	annual herb	-	-	FACU	-
Microseris elegans	Elegant silverpuffs	native	annual herb	-	-	-	-
Mimetanthe pilosa	Snouted monkey flower	native	annual herb	-	-	FACW	-
Minuartia californica	Sandwort	native	annual herb	-	-	FACU	1.7
Minuartia douglasii	Douglas' sandwort	native	annual herb	-	-	-	3
Monardella villosa ssp. *villosa*	Coyote mint	native	perennial herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Monardella viridis	Green monardella	native	perennial herb	Rank 4.3	-	-	1
Montia fontana	Water montia	native	annual herb	-	-	OBL	-
Morus alba	Mulberry	non-native	tree	-	-	FACU	-
Muhlenbergia rigens	Deergrass	native	perennial grass	-	-	FAC	-
Myriophyllum sp.	Water-milfoil	non-native	perennial herb	-	-	OBL	-
Myriopteris covillei	Coville's lip fern	native	fern	-	-	-	-
Narcissus pseudonarcissus	Daffodil	non-native	perennial herb (bulb)	-	-	-	-
Navarretia atractyloides	Holly leaf navarretia	native	annual herb	-	-	-	-
Navarretia cotulifolia	Cotula navarretia	native	annual herb	Rank 4.2	-	OBL	-
Navarretia intertexta	Interwoven navarretia	native	annual herb	-	-	FACW	-
Navarretia jepsonii	Jepson's navarretia	native	annual herb	Rank 4.3	-	FACW	5.6
Navarretia leucocephala ssp. *leucocephala*	White headed navarretia	native	annual herb	-	-	OBL	-
Navarretia mellita	Skunk navarretia	native	annual herb	-	-	FAC	-
Navarretia pubescens	Purple navarretia	native	annual herb	-	-	-	2
Navarretia squarrosa	Skunkweed	native	annual herb	-	-	FACU	-
Nemacladus montanus	Mountain nemacladus	native	annual herb	-	-	-	6
Nemophila heterophylla	Canyon nemophila	native	annual herb	-	-	-	-
Nemophila menziesii var. *atomaria*	Baby blue eyes	native	annual herb	-	-	-	-
Nemophila menziesii var. *menziesii*	Baby blue eyes	native	annual herb	-	-	-	-
Nemophila parviflora var. *parviflora*	Small flowered nemophila	native	annual herb	-	-	-	-
Nicotiana acuminata var. *multiflora*	Many flowered tobacco	non-native	annual herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Oemleria cerasiformis	Oso berry	native	shrub	-	-	FACU	-
Packera eurycephala var. *eurycephala*	Widehead groundsel	native	perennial herb	-	-	-	-
Packera greenei	Flame ragwort	native	perennial herb	-	-	-	-
Parentucellia viscosa	Yellow glandweed	non-native (invasive)	annual herb	-	Limited	FAC	-
Paspalum dilatatum	Dallis grass	non-native	perennial grass	-	-	FAC	-
Pectocarya pusilla	Little pectocarya	native	annual herb	-	-	-	1.3
Pedicularis densiflora	Indian warrior	native	perennial herb	-	-	-	-
Pellaea andromedifolia	Coffee fern	native	fern	-	-	-	-
Pellaea mucronata var. *mucronata*	Bird's foot fern	native	fern	-	-	-	-
Penstemon heterophyllus var. *heterophyllus*	Foothill penstemon	native	perennial herb	-	-	-	-
Penstemon heterophyllus var. *purdyi*	Purdy's foothill penstemon	native	perennial herb	-	-	-	-
Pentagramma triangularis	Gold back fern	native	fern	-	-	-	-
Perideridia gairdneri ssp. *borealis*	Northern Gairdner's yampah	native	perennial herb	-	-	FAC	-
Perideridia kelloggii	Kellogg's yampah	native	perennial herb	-	-	-	2.1
Persicaria amphibia	Water smartweed	native	perennial herb (aquatic)	-	-	OBL	-
Persicaria maculosa	Spotted ladysthumb	non-native	annual herb	-	-	FACW	-
Persicaria punctata	Dotted smartweed	native	perennial herb	-	-	OBL	-
Petrorhagia dubia	Windmill pink	non-native	annual herb	-	-	-	-
Phacelia distans	Common phacelia	native	annual herb	-	-	OBL	1.1
Phacelia imbricata var. *imbricata*	Imbricate phacelia	native	annual herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Phalaris aquatica	Harding grass	non-native (invasive)	perennial grass	-	Moderate	FACU	-
Phalaris lemmonii	Lemmon's canarygrass	native	annual grass	-	-	FACW	-
Phalaris minor	Mediterranean canarygrass	non-native	annual grass	-	-	-	-
Phalaris paradoxa	Hood canarygrass	non-native	annual grass	-	-	FAC	-
Phoradendron bolleanum	Bollean mistletoe	native	shrub (parasitic)	-	-	-	-
Phoradendron leucarpum ssp. *tomentosum*	Mistletoe	native	shrub (parasitic)	-	-	-	-
Phyla nodiflora	Common lippia	native	perennial herb	-	-	FACW	-
Physalis lanceifolia	Narrow leaf tomatillo	non-native	annual herb	-	-	UPL	-
Pickeringia montana var. *montana*	Chaparral pea	native	shrub	-	-	-	-
Pinus attenuata	Knobcone pine	native	tree	-	-	-	2.5
Pinus ponderosa var. *pacifica*	Pacific ponderosa pine	native	tree	-	-	FACU	-
Pinus sabiniana	Bull pine	native	tree	-	-	-	1.4
Piperia transversa	Mountain piperia	native	perennial herb	-	-	-	-
Plagiobothrys bracteatus	Bracted allocarya	native	annual herb	-	-	FACW	-
Plagiobothrys fulvus var. *campestris*	Tawny popcorn flower	native	annual herb	-	-	-	-
Plagiobothrys glyptocarpus var. *glyptocarpus*	Sculptured allocarya	native	annual herb	-	-	FACW	-
Plagiobothrys greenei	Greene's allocarya	native	annual herb	-	-	FACW	-
Plagiobothrys nothofulvus	Rusty haired popcorn flower	native	annual herb	-	-	FAC	-
Plagiobothrys stipitatus var. *micranthus*	Common vernal pool allocarya	native	annual herb	-	-	FACW	-
Plantago coronopus	Cut leaf plantain	non-native	annual herb	-	-	FAC	-
Plantago erecta	California plantain	native	annual herb	-	-	-	1

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Plantago lanceolata	Ribwort	non-native (invasive)	perennial herb	-	Limited	FAC	-
Plantago patagonica	Patagonia plantain	native	annual herb	-	-	-	-
Platanus ×hispanica	London plane tree	non-native	tree	-	-	-	-
Platystemon californicus	Cream cups	native	annual herb	-	-	-	1.7
Plectritis ciliosa	Long spurred plectritis	native	annual herb	-	-	FACU	-
Plectritis macrocera	Plectritis	native	annual herb	-	-	FACU	-
Pleuropogon californicus var. *californicus*	Annual semaphoregrass	native	annual grass	-	-	OBL	-
Poa annua	Annual blue grass	non-native	annual grass	-	-	FAC	-
Poa bulbosa ssp. *bulbosa*	Bulbous blue grass	non-native	perennial grass	-	-	FACU	-
Poa pratensis ssp. *pratensis*	Kentucky blue grass	non-native (invasive)	perennial grass	-	Limited	FAC	-
Poa secunda ssp. *secunda*	Sandberg's bluegrass	native	perennial grass	-	-	FACU	-
Pogogyne douglasii	Douglas' pogogyne	native	annual herb	-	-	OBL	-
Pogogyne zizyphoroides	Sacramento mint	native	annual herb	-	-	OBL	-
Polygala californica	Milkwort	native	perennial herb	-	-	-	-
Polygonum aviculare ssp. *aviculare*	Prostrate knotweed	non-native	annual, perennial herb	-	-	FACW	-
Polypodium californicum	California polypody	native	fern	-	-	-	-
Polypodium calirhiza	Licorice fern	native	fern	-	-	-	-
Polypogon interruptus	Ditch beard grass	non-native	perennial grass	-	-	FACW	-
Polypogon maritimus	Mediterranean beard grass	non-native	annual grass	-	-	OBL	-
Polypogon monspeliensis	Annual beard grass	non-native (invasive)	annual grass	-	Limited	FACW	-
Populus fremontii ssp. *fremontii*	Cottonwood	native	tree	-	-	FAC	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Portulaca oleracea	Common purslane	non-native	annual herb	-	-	FAC	-
Primula hendersonii	Mosquito bill	native	perennial herb	-	-	-	-
Prunus cerasifera	Cherry plum	non-native (invasive)	tree	-	Limited	-	-
Pseudognaphalium californicum	Ladies' tobacco	native	annual, perennial herb	-	-	-	-
Pseudognaphalium luteoalbum	Jersey cudweed	non-native	annual herb	-	-	FAC	-
Pseudotsuga menziesii var. *menziesii*	Douglas fir	native	tree	-	-	FACU	-
Psilocarphus brevissimus var. *brevissimus*	Woolly heads	native	annual herb	-	-	FACW	-
Psilocarphus chilensis	Round woolly marbles	native	annual herb	-	-	FACW	-
Pteridium aquilinum var. *pubescens*	Western bracken fern	native	fern	-	-	FACU	-
Pterostegia drymarioides	Fairy mist	native	annual herb	-	-	-	-
Quercus ×morehus	Oracle oak	native	tree	-	-	-	-
Quercus berberidifolia	Inland scrub oak	native	tree	-	-	-	-
Quercus chrysolepis	Gold cup live oak	native	tree	-	-	-	-
Quercus douglasii	Blue oak	native	tree	-	-	-	-
Quercus durata var. *durata*	Leather oak	native	shrub	-	-	-	5.8
Quercus kelloggii	California black oak	native	tree	-	-	-	-
Quercus lobata	Valley oak	native	tree	-	-	FACU	-
Quercus wislizeni var. *wislizeni*	Interior live oak	native	tree, shrub	-	-	-	-
Rafinesquia californica	California chicory	native	annual herb	-	-	-	-
Ranunculus aquatilis var. *aquatilis*	Whitewater crowfoot	native	perennial herb (aquatic)	-	-	OBL	-
Ranunculus californicus var. *californicus*	Common buttercup	native	perennial herb	-	-	FACU	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Ranunculus hebecarpus	Pubescent fruited buttercup	native	annual herb	-	-	-	-
Ranunculus muricatus	Buttercup	non-native	annual, perennial herb	-	-	FACW	-
Ranunculus occidentalis var. *occidentalis*	Western buttercup	native	perennial herb	-	-	FAC	-
Raphanus raphanistrum	Jointed charlock	non-native	annual, perennial herb	-	-	-	-
Raphanus sativus	Wild radish	non-native (invasive)	annual, biennial herb	-	Limited	-	-
Rhamnus ilicifolia	Evergreen buckthorn	native	shrub	-	-	-	-
Rhododendron occidentale	Western azalea	native	tree, shrub	-	-	FAC	-
Rhus aromatica	Fragrant sumac	native	shrub	-	-	FACU	-
Ribes malvaceum var. *malvaceum*	Chaparral currant	native	shrub	-	-	-	-
Rigiopappus leptocladus	Wire weed	native	annual herb	-	-	-	1.9
Robinia pseudoacacia	Black locust	non-native (invasive)	tree	-	Limited	FACU	-
Rosa californica	California wild rose	native	shrub	-	-	FAC	-
Rubus armeniacus	Himalayan blackberry	non-native (invasive)	shrub	-	High	FAC	-
Rumex crispus	Curly dock	non-native (invasive)	perennial herb	-	Limited	FAC	-
Rumex pulcher	Fiddleleaf dock	non-native	perennial herb	-	-	FAC	-
Salix breweri	Serpentine willow	native	shrub	-	-	FAC	6
Salix exigua var. *hindsiana*	Sandbar willow	native	tree, shrub	-	-	FACW	-
Salix gooddingii	Gooding's willow	native	tree	-	-	FACW	-
Salix laevigata	Polished willow	native	tree	-	-	FACW	-
Salix lasiolepis	Arroyo willow	native	tree, shrub	-	-	FACW	-
Salsola sp.	Russian thistle	non-native	annual herb	-	-	-	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Salvia columbariae	Chia sage	native	annual herb	-	-	-	-
Salvia sonomensis	Sonoma sage	native	perennial herb	-	-	-	1.6
Sambucus nigra ssp. *caerulea*	Blue elderberry	native	shrub	-	-	FAC	-
Sanicula bipinnata	Poison sanicle	native	perennial herb	-	-	-	-
Sanicula bipinnatifida	Purple sanicle	native	perennial herb	-	-	-	1.8
Sanicula crassicaulis	Pacific sanicle	native	perennial herb	-	-	-	-
Sanicula tuberosa	Turkey pea	native	perennial herb	-	-	-	1.3
Schoenoplectus acutus var. *occidentalis*	Tule	native	perennial grasslike herb	-	-	OBL	-
Schoenoplectus tabernaemontani	Softstem bulrush	native	perennial grasslike herb	-	-	OBL	-
Scleranthus annuus ssp. *annuus*	German knotgrass	non-native	annual herb	-	-	FACU	-
Scrophularia californica	California bee plant	native	perennial herb	-	-	FAC	-
Scutellaria antirrhinoides	Snapdragon skullcap	native	perennial herb	-	-	-	2.3
Scutellaria californica	California skullcap	native	perennial herb	-	-	-	-
Scutellaria siphocampyloides	Gray leaved skullcap	native	perennial herb	-	-	FACU	-
Scutellaria tuberosa	Dannie's skullcap	native	perennial herb	-	-	-	-
Senecio aronicoides	Butterweed	native	perennial herb	-	-	-	-
Senecio clevelandii var. *clevelandii*	Cleveland's ragwort	native	perennial herb	Rank 4.3	-	-	-
Senecio vulgaris	Common groundsel	non-native	annual herb	-	-	FACU	-
Sherardia arvensis	Field madder	non-native	annual herb	-	-	-	-
Sidalcea diploscypha	Fringed checker mallow	native	annual herb	-	-	-	2.6
Sidalcea hartwegii	Hartweg's checkerbloom	native	annual herb	-	-	-	1.6
Sidalcea hirsuta	Hairy checkerbloom	native	annual herb	-	-	OBL	-

Scientific Name	Common Name	Origin	Form	Conservation Status[1]	Cal-IPC Status[2]	Wetland Status[3]	Serpentine Affinity[4]
Sidalcea keckii	Keck's checkerbloom	native	annual herb	FE, Rank 1B.1	-	-	3
Silene gallica	Common catchfly	non-native	annual herb	-	-	-	-
Silene laciniata ssp. *californica*	California indian pink	native	perennial herb	-	-	-	-
Silybum marianum	Milk thistle	non-native (invasive)	annual, perennial herb	-	Limited	-	-
Sisymbrium irio	London rocket	non-native (invasive)	annual herb	-	Moderate	-	-
Sisymbrium officinale	Hedge mustard	non-native	annual herb	-	-	-	-
Sisyrinchium bellum	Blue eyed grass	native	perennial herb	-	-	FACW	-

[2]Key to Cal-IPC Status (Cal-IPC 2019):

High: These species have severe ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal and establishment. Most are widely distributed ecologically.

Moderate: These species have substantial and apparent—but generally not severe—ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal, though establishment is generally dependent upon ecological disturbance. Ecological amplitude and distribution may range from limited to widespread.

Limited: These species are invasive but their ecological impacts are minor on a statewide level or there was not enough information to justify a higher score. Their reproductive biology and other attributes result in low to moderate rates of invasiveness. Ecological amplitude and distribution are generally limited, but these species may be locally persistent and problematic.

[3]Key to Wetland Status (Lichvar et al. 2016):

OBL Obligate plant; almost always occurs in wetlands.
FACW Facultative wetland plant; usually occurs in wetlands, but may occur in non-wetlands.
FAC Facultative plant; occurs in wetlands and nonwetlands.
FACU Facultative upland plant; usually occurs in non-wetlands, but may occur in wetlands.
UPL Upland plant; almost never occur in wetlands.

1.0 INTRODUCTION

1.1 Study Background

On October 22, 2018, WRA conducted a routine wetland delineation at 21000 Santa Clara Road, Middletown, Lake County, California (Study Area) (Figure 1) to determine the presence of potential wetlands and non-wetland waters (collectively referred to as "Waters of the U.S.") subject to federal jurisdiction under Section 404 of the Clean Water Act (CWA). This report presents the methods and results of the delineation.

All figures referenced in the text are included in Appendix A.

1.2 Regulatory Background

Section 404 of the Clean Water Act

Section 404 of the Clean Water Act gives the Environmental Protection Agency (EPA) and the Corps regulatory and permitting authority regarding discharge of dredged or fill material into "navigable waters of the United States." Section 502(7) of the CWA defines "navigable waters" as "waters of the United States, including territorial seas." Section 328 of Chapter 33 in the Code of Federal Regulations (CFR) defines the term "waters of the United States" as it applies to the jurisdictional limits of the authority of the Corps under the CWA. A summary of the definition of "waters of the United States" in 33 CFR 328.3 (a) includes (1) waters used for commerce; (2) interstate waters and wetlands; (3) territorial seas; (4) impoundments of waters listed here; (5) tributaries to the above waters; (6) waters and wetlands adjacent to the above waters; and (7) prairie potholes, Carolina and Delmarva bays, Pocosins, western vernal pools, and Texas coastal prairie wetlands, provided these features have a significant nexus to the above listed waters[1]; (8) all waters located within the 100-year floodplain of waters listed above in items 1-3 or within 4,000 feet of the high tide line (HTL) or ordinary high water mark (OHWM) of a water listed above in items 1-5, provided those waters are determined to have a significant nexus to waters identified in items 1-3 above. For purposes of the determining Corps jurisdiction under the CWA, "navigable waters" as defined in the CWA are the same as "waters of the U.S." defined in 33 CFR 328.3.

Areas not considered to be "waters of the United States" as defined in 33 CFR 328.3 (b), are summarized as follows: (1) waste treatment systems; (2) prior converted cropland; (3) specific classes of ditches, including (i) ditches with ephemeral flow that are not a relocated tributary or excavated in a tributary, (ii) ditches with intermittent flow that are not a relocated tributary, excavated in a tributary, or drain wetlands, and (iii) ditches that do not flow, either directly or through another water, into a water identified in 33 CFR 328.3 paragraphs (a) (1) through (3); (4) artificially irrigated areas that would otherwise revert to dry land and manmade aquatic features in otherwise dry land such as stock watering ponds, irrigation ponds, settling basins, fields flooded for rice growing, log cleaning ponds, cooling ponds, reflecting pools, swimming pools, small ornamental waters, depressions incidental to mining and construction activity, erosional features, and puddles; (5) groundwater; (6) stormwater control features; (7)

[1] Wetlands and non-wetland waters in this category are similarly situated and are combined, for purposes of a significant nexus analysis, in the watershed that drains to the nearest water identified in paragraphs (a)(1) through (3) of 33 CFR 328.3.

wastewater recycling structures, groundwater recharge basins, percolation ponds for wastewater recycling, and distribution networks for wastewater recycling.

1.2.1 Wetlands

Wetlands are defined in 33 CFR 328.3 (c) as:

> *…those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.*

The basis for determining whether a given area is a wetland for the purposes of Section 404 of the CWA is outlined in the Corps *Wetlands Delineation Manual* (Environmental Laboratory 1987) and the *Regional Supplement to the Corps of Engineers* Delineation Manual for the respective region. As defined in 33 CFR 328.4 (c), the extent of federal jurisdiction within wetlands is defined as extending to the limit of the wetland as determined using the methods outlined in the manuals.

1.2.2 Non-Wetland Waters

The limit of federal jurisdiction in non-tidal non-wetland waters extends to the OHWM which is defined in 33 CFR 328.3 (e) as:

> *...that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impresses on the bank, shelving, changes in the characteristics of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.*

2.0 SUMMARY OF POTENTIAL JURISDICTIONAL AREAS

Figure 2 in Appendix A depicts the extent of Corps jurisdiction within the Study Area based on a wetland delineation conducted by WRA on October 22, 2018. The acreage of potential Section 404 jurisdictional areas is summarized in Table 1 below.

Table 1. Summary of Potential Section 404 Jurisdictional Areas within the Study Area

Habitat Type	Size	"Potentially Isolated" Areas (acres)	Potential Jurisdictional Waters of the U.S.
Non-Wetland Waters:			
Intermittent Stream (within OHWM)	0.41 ac (227 l.f.)	0	0.41 ac (227 l.f.)
TOTAL			**0.41 ac (227 l.f.)**

3.0 METHODS

Prior to conducting field surveys, reference materials were reviewed, including the Soil Survey of Lake County (USDA 1989), online soil data (CSRL 2018, USDA 2018a), National Wetland Inventory (NWI) data (USFWS 2018), rainfall data (NRCS 2019), regional precipitation data (NCRS 2018b), the Middletown USGS 7.5' quadrangle (USGS 2018), and aerial photos of the site (Google Earth 2018).

A focused evaluation of indicators of wetlands and non-wetland waters was performed in the Study Area on October 22, 2018. The methods used in this study to delineate jurisdictional wetlands and non-wetland waters are based on the *U.S. Army Corps of Engineers Wetlands Delineation Manual* ("Corps Manual"; Environmental Laboratory 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* ("Arid West Supplement"; Corps 2008). The routine method for wetland delineation described in the Corps Manual was used to identify areas potentially subject to Corps Section 404 jurisdiction within the Study Area. A general description of the Study Area, including plant communities present, topography, and land use was also generated during the delineation visit. The methods for evaluating the presence of wetlands and non-wetland waters employed during the site visit are described in detail below.

3.1 Potential Section 404 Waters of the U.S.

3.1.1 Wetlands

The Study Area was evaluated for the presence or absence of indicators of the three wetland parameters described in the Corps Manual (Environmental Laboratory 1987) and Arid West Supplement (Corps 2008).

Section 328.3 of the Federal Code of Regulations defines wetlands as:

"Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."

EPA, 40 CFR 230.3 and CE, 33 CFR 328.3 (b)

The three parameters used to delineate wetlands are the presence of: (1) hydrophytic vegetation, (2) wetland hydrology, and (3) hydric soils. According to the Corps Manual, for areas not considered "problem areas" or "atypical situations":

"....[E]vidence of a minimum of one positive wetland indicator from each parameter (hydrology, soil, and vegetation) must be found in order to make a positive wetland determination."

Data on vegetation, hydrology, and soils collected at sample points during the delineation site visit was reported on Arid West Supplement data forms. Once an area was determined to be a potential jurisdictional wetland, its boundaries were delineated using GPS equipment and mapped on a topographic map. The areas of potential jurisdictional wetlands were measured digitally using ArcGIS software. Indicators described in the Arid West Supplement were used to make wetland determinations at each sample point in the Study Area and are summarized below.

Vegetation

Plant species observed in the Study Area were identified using the Jepson Manual, Second Edition (Baldwin et al. 2012) and the Jepson eFlora (Jepson Flora Project 2018). Plants were assigned a wetland indicator status according to the National Wetland Plant List (NWPL; Lichvar 2016). Where differences in nomenclature occur between the Jepson Manual or the Jepson eFlora, and the NWPL, the species name as it occurred in the NWPL is listed in brackets. Other relevant synonyms may also be provided in brackets.

Wetland indicator statuses listed in the NWPL are based on the expected frequency of occurrence in wetlands as follows:

Indicator Status	Definition	Hydrophytic Species? (Y/N)
Obligate (OBL)	Almost always is a hydrophyte, rarely in uplands	Y
Facultative Wetland (FACW)	Usually is a hydrophyte but occasionally found in uplands	Y
Facultative (FAC)	Commonly occurs as either a hydrophyte or non-hydrophyte	Y
Facultative Upland (FACU)	Occasionally is a hydrophyte but usually occurs in uplands	N
Upland/Not Listed (UPL/NL)	Rarely is a hydrophyte, almost always in uplands	N

The presence of hydrophytic vegetation was then determined based on indicator tests described in the Arid West Supplement. The Arid West Supplement requires that a three-step process be conducted to determine if hydrophytic vegetation is present. The procedure first requires the delineator to apply the "50/20 rule" (Indicator 1; Dominance Test) described in the manual. To apply the "50/20 rule", dominant species are chosen independently from each stratum of the community. Dominant species are determined for each vegetation stratum from a sampling plot of an appropriate size surrounding the sample point. Dominants are the most abundant species that individually or collectively account for more than 50 percent of the total vegetative cover in the stratum, plus any other species that, by itself, accounts for at least 20 percent of the total vegetative cover. If greater than 50 percent of the dominant species has an OBL, FACW, or FAC status, the sample point meets the hydrophytic vegetation criterion.

If the sample point fails Indicator 1 and both hydric soils and wetland hydrology are not present, then the sample point does not meet the hydrophytic vegetation criterion, unless the site is a problematic wetland situation. However, if the sample point fails Indicator 1 but hydric soils and wetland hydrology are both present, the delineator must apply Indicator 2.

Indicator 2 is known as the Prevalence Index. The prevalence index is a weighted average of the wetland indicator status for all plant species within the sampling plot. Each indicator status is given a numeric code (OBL = 1, FACW = 2, FAC = 3, FACU = 4, and UPL = 5). Indicator 2 requires the delineator to estimate the percent cover of each species in every stratum of the community and sum the cover estimates for any species that is present in more than one stratum. The delineator must then organize all species into groups according to their wetland indicator status and calculate the Prevalence Index using the following formula, where A equals total percent cover:

$$PI = \frac{A_{OBL} + 2A_{FACW} + 3A_{FAC} + 4A_{FACU} + 5A_{UPL}}{A_{OBL} + A_{FACW} + A_{FAC} + A_{FACU} + A_{UPL}}$$

The Prevalence Index will yield a number between 1 and 5. If the Prevalence Index is equal to or less than 3, the sample point meets the hydrophytic vegetation criterion. However, if the community fails Indicator 2, the delineator must proceed to Indicator 3.

Indicator 3 is known as Morphological Adaptations. If more than 50 percent of the individuals of a FACU species have morphological adaptations for life in wetlands, that species is considered to be a hydrophyte and its indicator status should be reassigned to FAC. If such observations are made, the delineator must recalculate Indicators 1 and 2 using a FAC indicator status for this species. The sample point meets the hydrophytic vegetation criterion if either test is satisfied.

Hydrology

The Corps jurisdictional wetland hydrology criterion is satisfied if an area is inundated or saturated for a period sufficient to create anoxic soil conditions during the growing season (a minimum of 14 consecutive days in the Arid West region). Evidence of wetland hydrology can include primary indicators, such as visible inundation or saturation, drift deposits, oxidized root channels, and salt crusts, or secondary indicators such as the FAC-neutral test, presence of a shallow aquitard, or crayfish burrows. The Arid West Supplement contains 16 primary

hydrology indicators and 10 secondary hydrology indicators. Only one primary indicator is required to meet the wetland hydrology criterion; however, if secondary indicators are used, at least two secondary indicators must be present to conclude that an area has wetland hydrology.

The presence or absence of the primary or secondary indicators described in the Arid West Supplement was utilized to determine if sample points within the Study Area met the wetland hydrology criterion.

Soils

The Natural Resource Conservation Service (NRCS) defines a hydric soil as follows:

> *"A hydric soil is a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part."*
>
> Federal Register July 13, 1994,
> U.S. Department of Agriculture, NRCS

Soils formed over long periods of time under wetland (anaerobic) conditions often possess characteristics that indicate they meet the definition of hydric soils. Hydric soils can have a hydrogen sulfide (rotten egg) odor, low chroma matrix color, generally designated 0, 1, or 2, used to identify them as hydric, presence of redox concentrations, gleyed or depleted matrix, or high organic matter content.

Specific indicators that can be used to determine whether a soil is hydric for the purposes of wetland delineation are provided in the NRCS *Field Indicators of Hydric Soils in the U.S.* (USDA 2010). The Arid West Supplement provides a list of 23 of these hydric soil indicators which are known to occur in the Arid West region. Soil samples were collected and described according to the methodology provided in the Arid West Supplement. Soil chroma and values were determined by utilizing a standard Munsell soil color chart (Munsell Color 2009).

Hydric soils were determined to be present if any of the soil samples met one or more of the 23 hydric soil indicators described in the Arid West Supplement.

3.1.2 Non-Wetland Waters

This study also evaluated the presence of non-wetland waters potentially subject to U.S. Army Corps of Engineers jurisdiction under Section 404 of the Clean Water Act. Non-wetland areas subject to Corps jurisdiction include lakes, rivers and streams (including intermittent streams) in addition to all areas below the HTL in areas subject to tidal influence. Jurisdiction in non-tidal areas extends to the ordinary high water mark (OHW) defined as:

> "*...that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impresses on the bank, shelving, changes in the characteristics of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.*"
>
> Federal Register Vol. 51, No. 219,
> Part 328.3 (e). November 13, 1986

Identification of the ordinary high water mark followed the Corps Regulatory Guidance Letter No. 05-05, *Ordinary High Water Mark Identification* (Corps 2005).

4.0 STUDY AREA DESCRIPTION

The Study Area is approximately 13.33 acres and is located in Middletown, Lake County California (Figure 1). The site is generally flat, with an elevation of approximately 1,098 feet WGS84. The Study Area is bound on the east and south by residential parcels, to the north by ruderal grassland and to the west by Dry Creek, a tributary of Putah Creek which flows into the Sacramento River, a Traditional Navigable Water (TNW).

A majority of the Study Area was burned in the Valley Fire of September 2015; the fire intensity was at a level which charred trees and large shrubs and cleared the herbaceous layer. The property is not developed. Portions of the site appear to be regularly disced to create fire breaks with the neighboring parcels. Regional land-uses include residential and commercial (Google Earth 2019). Historically, the region was likely open rangeland composed of small ranches.

Vegetation

Vegetation within the Study Area is composed of native and non-native grasslands and small patches of oak woodland, with a narrow band of riparian scrub associated with Dry Creek. The non-native grasslands are dominated by non-native grasses including wild oat (*Avena barbata*, NL), soft chess (*Bromus hordeaceus*, FACU), medusa head (*Elymus caput-medusae*, NL), and rye (*Secale* sp., NL). Non-native forbs including vetch (*Vicia* spp., FACU), rose clover (*Trifolium hirtum*, NL), western filaree (*Erodium moschatum*, NL), big heron bill (*Erodium botrys*, FACU), and yellow star thistle (*Centaurea solstitialis*, NL) are characteristically present within the non-native grassland. The native grassland is dominated by squirreltail grass (*Elymus multisetus*, NL) with California poppy (*Eschscholzia californica*, NL), California plantago (*Plantago erecta*, NL), tarweed (*Hemizonia congesta* ssp. *clevelandii*, NL.), q-tips (*Micropus californicus*, FACU), soft chess, purple flower owl's clover (*Castilleja exserta*, NL) as associated species. The oak woodland is dominated by valley oak (*Quercus lobata*, FACU) with non-native grassland understory. The riparian scrub is characterized by arroyo willow thickets. The riparian scrub was burned during the Valley Fire and is returning, forming woody thickets mixed with open herbaceous areas. The herbaceous areas have dense cover of wetland species including tall cyperus (*Cyperus eragrostis*, FACW), iris-leaved rush (*Juncus xiphioides*, OBL), fiddleleaf dock (*Rumex pulcher*, FAC), annual beard grass (*Polypogon monspeliensis*, FACW), and western goldenrod (*Euthamia occidentalis*, FACW).

Hydrology

The primary hydrologic sources are direct precipitation and consequent sheet flow, as well as channelized stream flow within the creek. Dry Creek, an intermittent stream located along the western boundary of the Study Area, captures water from the Study Area and moves it downstream approximately 0.39 miles northeast to Putah Creek which eventually enters Lake Berryessa before flowing into the Sacramento River via the Yolo Bypass.

Precipitation predominantly falls as rainfall with an annual average for Middletown of 44.1 inches. Precipitation-bearing weather systems are predominantly from the west and south with

the majority of rain falls between November and March, with a combined average of 36.95 inches (NRCS 2019).

Soils

The overall topography of the Study Area is flat, and elevations are at approximately 1,100 feet above sea level. According to the *Soil Survey of Lake County* (USDA 1989), the Study Area is underlain by three soil mapping units: Kelsey Fine Sandy Loam, Talmage Very Gravelly Sandy Loam, and Xerofluvents, Very Gravelly. The parent soil series of these mapping units are summarized below. Figure 3 in Appendix A depicts the extent of each soil type.

Kelsey series: This series consists of very deep fine sandy loam that formed in alluvium from mixed rock sources situated on floodplains ranging from 900 to 1,600 feet. Soil pH is neutral (7.0) to slightly alkaline (7.4). These soils are listed as hydric in Lake County, but are well drained with very slow runoff and moderately rapid permeability and did not display field indicators of hydric soils. Native vegetation includes annual grasses and forbs with scattered valley oaks (*Quercus lobata*). A typical pedon contains an A horizon of fine sandy loam from 0 to 11 inches in depth with colors consisting of very dark greyish brown (10YR 3/2). The A horizon is underlain by a series of sandy loam alluvial depositional layers from 11 inches to 60 inches in depth. (USDA 1989, CSRL 2019).

Talmage Series: This series consist of very deep gravelly sandy loam formed in alluvium from mixed rock alluvial fans and plains at elevations ranging from 350 to 1,800 feet. Soil pH is slightly acidic (6.5) to neutral (7.0). These soils are listed as hydric in Lake County, but are somewhat excessively drained with slow to medium runoff and moderately rapid permeability and did not display field indicators of hydric soils. Native vegetation typically includes annual grasses and forbs with scattered oaks (*Quercus* spp.). A typical pedon contains an A horizon of gravelly or very gravelly sandy loam from 0 to 19 inches in depth with colors consisting of very dark greyish brown (10YR 3/2) to dark brown (10YR 3/3) and a C horizon of extremely gravelly coarse sandy loam from 19 to 66 inches below the surface with colors consisting of dark brown (10YR 4/3) (USDA 1989, CSRL 2019).

Xerofluvents Very Gravelly: This map unit consist of very deep, excessively drained soils formed from gravelly alluvium from mixed rock on narrow floodplains adjacent to stream channels.. These soils are listed as hydric in Lake County, but have very slow runoff with rapid permeability and did not display field indicators of hydric soils. Native vegetation typically includes vinegar weed (*Trichostema* spp.), foxtail fescue (*Festuca myuros*), and filaree (*Geranium* spp.) (USDA 1989).

5.0 RESULTS

Potential Waters of the U.S. are described in the following sections and depicted on Figure 2 in Appendix A. Vegetation, soils and hydrology data collected during delineation site visits are reported on standard Corps Arid West Region data forms provided in Appendix B. Photos of representative portions of the Study Area and sample points are shown in Appendix C. A list of plant species observed during the site visit is included in Appendix D.

5.1 Potential Section 404 Waters of the U.S

5.1.1 Wetlands

The riparian scrub is the only location within the Study Area dominated by hydrophytic vegetation. However, soils did not display field indicators of hydric soils and indicators of wetland hydrology were not observed, therefore the riparian scrub was not considered wetland. No other areas within the Study Area contained any of the three parameters; upland sample points were taken to document upland conditions. Besides the riparian scrub vegetation, no areas within the Study Area showed indicators of wetlands.

5.1.2 Non-Wetland Waters

Approximately 227 linear feet of Dry Creek is located along the western boundary of the Study Area. The OHWM is approximately 60 to 90 feet in width, with a gravelly, unvegetated bed. No water was observed within the stream during the October site visit. Features used to delineate the OHWM included absence of vegetation, shelving, wrack, and scour. The banks are steep to somewhat steep, consisting of sand and soil, ranging from 5 to 8 feet in height.

6.0 POTENTIAL CORPS OF ENGINEERS JURISDICTION

The 13.33 acre Study Area has no wetlands and 0.41 acre (227 linear feet) of non-wetland waters that may be considered jurisdictional under Section 404 of the Clean Water Act. The riparian scrub vegetation was the only area meeting hydrophytic vegetation and no areas containing hydric soil or hydrology indicators were observed. Dry Creek has clear indicators of an OWHM and is a tributary to a “navigable waters of the U.S.” and therefore meets the definition of a Waters of the U.S. under Section 404 of the Clean Water Act.

The conclusion of this delineation is based on conditions observed at the time of the field surveys conducted on October 22, 2018.

[1]Rare Status: The CNPS Inventory of Rare and Endangered Plants (CNPS 2019a)

FE: Federal Endangered
FT: Federal Threatened
SE: State Endangered
ST: State Threatened
SR: State Rare
Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere
Rank 1B: Plants rare, threatened, or endangered in California and elsewhere
Rank 2A: Plants presumed extirpated in California, but more common elsewhere
Rank 2B: Plants rare, threatened, or endangered in California, but more common elsewhere
Rank 3: Plants about which we need more information – a review list
Rank 4: Plants of limited distribution – a watch list

[2]Invasive Status: California Invasive Plant Inventory (Cal-IPC 2019)

High: Severe ecological impacts; high rates of dispersal and establishment; most are widely distributed ecologically.
Moderate: Substantial and apparent ecological impacts; moderate-high rates of dispersal, establishment dependent on disturbance; limited-moderate distribution ecologically
Limited: Minor or not well documented ecological impacts; low-moderate rate of invasiveness; limited distribution ecologically
Assessed: Assessed by Cal-IPC and determined to not be an existing current threat

[3]Wetland Status: National List of Plant Species that Occur in Wetlands, Arid West Region (Lichvar et al. 2016)

OBL: Almost always a hydrophyte, rarely in uplands

FACW:	Usually a hydrophyte, but occasionally found in uplands
FAC:	Commonly either a hydrophyte or non-hydrophyte
FACU:	Occasionally a hydrophyte, but usually found in uplands
UPL:	Rarely a hydrophyte, almost always in uplands

GEOLOGIC NOTATIONS

Jv	Volcanic Rocks, mainly basalt
KJf	Franciscan Formation (ss-sandstone, shale, conglomerate, ch-chert, gs-greenstone, mg-metagraywacke)
KJu	Lower Cretaceous and Upper Jurassic Rocks (undifferentiated marine mudstone, sandstone, and conglomerate (includes "Knoxville Formation")
Ku	Upper Cretaceous (undifferentiated marine rocks)
Q\Qa\Qb	Alluvium (Quaternary period, poorly sorted stream and basin deposits, clay to boulder size)
Qt	Terrace deposits
QTc	Cache Formation (Includes Pleistocene Kelsyville and Lower Lake Formations of Rymer, 1980. Pebbly sandstone, conglomerate, siltstone, and tuff; nonmarine)
QTcv	Clear Lake Volcanics (d-dacite, a-andesite to basaltic rock, b-basalt, r-rhyolite, t-tuff and other pyroclastic rocks)
um	Ultramafic Rocks (Peridotite) (partly to complete serpentinized)

Note: geologic notations and descriptions from California Geological Survey, Regional Geologic Map, Santa Rosa Quadrangle (1982)

EXECUTIVE SUMMARY

This Water Supply Assessment (WSA) analyzes the existing and planned future water demands and available water supplies for the proposed Maha Resort at Guenoc Valley (Project), including Phase One and a future phase of development. The report demonstrates that the Project has existing available water supplies from two sources, local surface water and groundwater, and a planned future supply of recycled (non-potable) water. In both normal and dry year conditions, for the year 2020 the Project site is expected to have a range of 9,163 to 16,223 acre-feet of water available annually. Projecting out to the year 2040 (and full build-out of the first phase and future phase), in both normal and dry year conditions the Project site will have a range of approximately 9,266 to 13,886 acre-feet of water available annually. For both potable and non-potable water needs, this available water supply significantly exceeds projected water demands, as analyzed from 2020 through 2040. More specifically, even with full build-out of the first phase and the Future Phase in 2040, an annual water surplus of at least 3,380 acre-feet of water is projected. Based on the analysis presented in this WSA, available sources of supply are anticipated to exceed Project and non-Project water demands in normal and dry years through 2040, consistent with the requirements of California Senate Bill 610.

1 INTRODUCTION

The proposed Maha Resort at Guenoc Valley (Project) would occur on a 16,000 acres site in southeastern Lake County (Project Area). The Project Area is located approximately three miles southeast of Middletown and currently supports agricultural land uses along with tourism-focused uses, including a hunting lodge and camp. The Project has applied to the County of Lake to rezone the Project Site to a new zoning designation the "Guenoc Valley District (GVD)". Pursuant to the California Environmental Quality Act (CEQA) the application will include an Environmental Impact Report (EIR). The EIR will include a programmatic analysis of the impacts to rezone the Project Site, the EIR will include a detailed, project level analysis of the impacts at a project level review of the first phase of development, submitted as the Specific Plan of Development (SPOD). The Project Level review EIR will analyze the environmental changes caused by a development including the construction and operation, whereas the programmatic EIR will evaluate impacts resulting from the rezone classification rather than a project specific analysis. Future phases of the project will require additional CEQA review. This Water Supply Assessment (WSA) analyzes both the first phase (Phase One) project level impacts and the potential future phase development within the new GVD zoning classification.

1.1 Purpose

California Senate Bill 610 (SB 610), which amended Part 2.10, Division 6 of the California Water Code in 2001, requires an evaluation of the sufficiency of water supplies to meet existing and planned future demands for water when proposed development projects meet certain minimum criteria (see Section 1.5). This Water Supply Assessment (WSA), provides an SB 610 evaluation, including existing and proposed water demands, for the Project Area. Water demands evaluated by this WSA include those planned to occur as part of the Project and other planned future uses in the Project Area and Adjacent Non-Project Areas with shared sources of supply (**Figure 1-1**). This WSA evaluates existing and planned

water supplies for the Project Area including surface water, groundwater, and recycled water. This WSA addresses the sufficiency of available water supplies to meet projected demands during normal, single-dry, and multiple-dry years over a twenty-year planning horizon, through 2040. Lake County is the Lead Agency for the Project.

1.2 Proposed Maha Resort at Guenoc Valley Project

The Maha Resort at Guenoc Valley is a proposed rezoning and development project located in southern Lake County. The Project includes luxury resorts and master planned residential community to be sited in clusters across the approximately 16,000-acre Project Area. The Project incorporates low impact designs that prioritize low density and clustered development, preserving surrounding open space and agricultural cultivation.

Phase One includes the construction of the roads and the utility infrastructure, approximately 225 hotel rooms, 144 resort residential units, 411 Residential villas, workforce and staff housing, and resort accessory commercial structures. The allowable uses within Future Phases evaluated as part of this WSA, include similar resort, resort accessory, and residential land uses, consistent with the development density presented in the Middletown Area Plan.

Each resort community or cluster will include a mixture of hotel units, resort residential and residential villas. The Project commercial elements will include small boutique hotels, commercial shops, and small artisanal food and winery production facilities, small farm and integrative animal husbandry elements and spa and restaurants. The key recreational facilities will include an equestrian center, an 18-hole golf course, rural recreation, and camping facilities.

The Project will also include essential operational facilities including workforce housing, central back-of-the-house operations, and emergency response center. Workforce housing is planned to be developed in Middletown, at a currently undeveloped parcel within the Collayomi County Water District Service Area.

The Project will likely form a privately held public utility company that will operate and maintain the water and sewer facilities at the property. Regulated water utilities are considered to be professional water service providers that own water and wastewater utilities, partner with municipalities to form public-private partnerships, or operate and maintain water and wastewater systems as contracted services providers. The new water system will likely be a Class B system that will serve between 2,000 to 10,000 service connections. New water supply infrastructure is being planned for the Project that will include both a potable and non-potable water systems.

1.2.1 Potable Water System

The potable water system will include three water systems serving separate parts of the Project Area: the Guenoc Valley area, the Upper Bohn Lake area, and the Camping area. The Guenoc Valley system will be designed to serve the Central Back of House area, the Equestrian Center and the Bohn Ridge

Resort. The Upper Bohn Lake system will serve the Maha Farm/Sales Center area, the Spa, Emergency Center and Support Services, the Red Hill Estates and Renaissance Golf Course, and the Resort at Trout Flat. A small water system will serve the remotely located Camping area.

Each water system will likely include a series of deep, water supply wells that will pump water to strategically placed water storage tanks.[1] Each tank will have a multi-pump booster station to maintain system pressures throughout the water distribution system. Each water system will include a water distribution system that will consist of a series of branched and looped water lines, where required to serve all commercial and residential parcels.

A series of potable water storage tanks will be installed at each water system. The domestic water storage tanks will be sized to satisfy the maximum day demand requirements for each area.

For the Guenoc Valley water system the total amount of water storage is estimated to be approximately 170,000 gallons. This will serve the Central Back of House area, the Equestrian Center and the Bohn Ridge Resort.

For the Upper Bohn Lake water system, a total of approximately 260,000 gallons of potable water storage capacity will be needed. For this system approximately 125,000 gallons of storage capacity will be needed at Maha Farms area and 135,000 gallons of storage capacity to serve the Red Hill Estate, the golf course, the Resort at Trout Flat, the Emergency Center and short-term staff accommodations and the Spa area.

The water storage tanks will likely be placed in elevated locations to provide gravity flow to the parcels served in the event of a power outage. The tanks will likely be placed on graded pads that will also be bermed with the cut material so that the grading cut and fill volume are closely balanced to avoid the transport of soils from these sites. In some locations, underground cisterns may be used to avoid impacts associated with aboveground tanks. The location of the tank and cistern sites can be selected and planned so that their installation and operation does not impact sensitive cultural, historic, and biotic resources at the site.

A system of booster pump systems located at the water storage tanks and possibly within the distribution system will be used to maintain a uniform operating pressure in each water system. It is anticipated that each booster pump system will include at least three (3) booster pumps plumbed in parallel that will be operated by a variable frequency drive controller to determine how many pumps are in operation at a given time to maintain the pressure requirements for the system. Under low or normal flow conditions it is likely that a single booster pump will be operating and, as the water demand increases, the additional standby pumps will turn on to maintain a constant flow and pressure throughout the distribution system.

[1] Water storage tanks may include both aboveground and underground facilities.

The booster pump systems will typically be installed in close proximity to the water storage tanks and will be placed in areas that are graded as a result of the storage tanks. The booster pump systems will be installed in small enclosures.

The water systems will consist of both branched in in some locations looped water distribution systems. The water distribution systems will consist primarily of 4-inch diameter water mains and 3- and 2-inch water laterals to supply the commercial building and residential parcels. The majority of the water mains and laterals will be installed in the planned roadways and driveways and will not be installed in undisturbed areas on the site, unless requested as part of the permitting process, and therefore should not result in any additional impacts to cultural, historic or biotic resources related to the installation of the new roads.

1.2.2 Non-Potable Water System

Two non-potable water system are also planned to be installed: one to serve development in the Guenoc Valley and a second system to serve the development in the Upper Bohn Lake area.

In general, both non-potable systems will include a new non-potable water distribution network, new surface water pumping systems, and wastewater recycling systems.

The non-potable water distribution will be constructed to supply fire and irrigation water demands for the site. The non-potable water distribution system will be a “purple pipe” system so that it can convey recycled water, as well as other sources of non-potable through the distribution system. The non-potable water distribution system will serve fire hydrants and external and internal fire sprinkler systems for commercial and residential buildings. The non-potable water distribution system will consist primarily of 8-inch and 6-inch water mains and 3-inch and 2-inch diameter laterals to serve fire sprinkler systems and residential properties to provide the required pressure. The majority of the non-potable water distribution system will be installed in planned roadways and driveways and should not result additional land disturbance and impacts to cultural, historic and biotic resources beyond impacts resulting from the construction of the new roads.

Both non-potable water systems will include new pumping systems located in the vicinity of the existing pumping systems at Detert, McCreary and Upper Bohn Lake. A new pump station will be installed in the vicinity of the flashboard dam installed across Bucksnort Creek downstream of McCreary Reservoir and this pump station will house two pumping systems: one pump station will convey water to Lower Bohn Lake and the second will pump water up to the new Renaissance Golf Course in the Red Hill area.

The new surface water pump stations on Detert and McCreary Reservoirs will be connected to the Guenoc Valley non-potable water system and will be used to supply irrigation, fire protection and make up water for water features and ponds in this area. The surface water pump stations placed on Bucksnort Lake and Upper Bohn Lake will be used to pump water to the non-potable water system in the Upper Bohn Lake Region for irrigation, fire protection and make up water for evaporative losses in water features and ponds.

The new surface water pump stations at the reservoirs will be installed adjacent to the existing pumping plants and will be placed in areas that have been graded and should not result in substantial ground disturbance during their construction and installation. The new pumping plant at Bucksnort Creek will be placed in a small area above the normal highwater mark and outside of the immediate riparian zone of the creek. It will likely be within 50 feet of the creek and with the riparian zone; however, it will be constructed in a location that will minimize impacts to sensitive cultural, historic and biotic resources in this area.

1.2.3 Recycled Water Facilities

Based on the remote locations of the clustered development plan, several small package type water recycling plants will be installed to treat wastewater from the development areas. Seven small package plants are currently planned to serve the Phase I project and will include small treatment works at the Maha Farm, Redhill/Renaissance Golf Course, Resort at Trout Flat, Central Back of the House, Equestrian Center and a small system at the Camping area.

The treatment systems will be designed to meet California Title 22 recycled water regulations for tertiary level disinfected recycled water that can be used for unrestricted irrigation and recreational use of the water.

At each water reclamation facility there will be a 100,000-gallon recycled water tank and booster pump system that will pump recycled water into the non-potable water distribution system for landscape irrigation, fire protection and make up water to ornamental water features and ponds.

Each water reclamation plant will cover a relatively small area ranging from less than 1,000 square feet at the Camping area to the largest area of 12,500 square feet for the largest system that will serve the Maha Farms area. The installation of all the water reclamation plants will require approximately two (2) acres of land.

The water reclamation plants will be placed in areas that are set back from the cluster developments to avoid potential odor and noise issues. The plants will be located close to planned roads to provide easy access to them and to avoid the need to construct long driveways or access roads to serve them. The plants will also be placed in areas that will minimize grading and ground disturbance to the extent practical and to avoid impacts to sensitive flora and fauna.

1.3 Report Organization

This report is structured to facilitate the presentation of information required by the Water Code including the analyses necessary to evaluate the sufficiency of the water supply to meet projected future demands. The WSA includes the following sections:

Section 1 provides an overview of the legal requirements for the WSA and describes the Project. Definitions of key terms are provided, and water resource management plans relevant to the Project are described.

Section 2 describes the Project Area and includes a summary of projected population growth, local climate, and existing and planned sources of water supply for the Project Area.

Section 3 describes the hydrogeology of the Project Area, including the geology, well, and aquifer characteristics for groundwater basins and non-basin areas.

Section 4 describes regional and local groundwater conditions including groundwater levels and groundwater quality. The section also presents data on historical and current water use and information on the availability of groundwater, surface water, and recycled water in the Project Area.

Section 5 describes future water demands based for both Phase One and a future phase of the Maha Resort at Guenoc Valley.

Section 6 addresses water supply sufficiency by comparing projected water demands in the Project Area to available supplies for normal, dry, and multiple-dry water year[2] conditions. This section includes a discussion of the permits and financing necessary to make the water supply available to the Project.

1.4 Scope of Analysis

This WSA includes a review of water resources and water supplies as well as existing and future planned water demands the Project Area to the year 2040, consistent with the requirements of SB 610.

Although not within the Project Area, areas covering approximately 505 acres along Bucksnort Creek and approximately 720 acres in Napa County are included in the WSA analysis, due to the inter-related nature of the existing water supply for those areas with the rest of the Project Area. These areas are referenced in this WSA as Adjacent Non-Project Areas; existing and planned land uses in these areas include vineyards, the Lillie Langtry House, and the Langtry Estate Winery. The WSA is intended to fulfill the requirements of SB 610, as described below.

1.5 SB 610 Requirements for Groundwater Sources

SB 610 became effective on January 1, 2002 with the intent to strengthen the process by which local agencies determine the adequacy and sufficiency of current and future water supplies to meet current and future demands. SB 610 amended the California Public Resources Code to incorporate Water Code findings within the CEQA process for certain types of projects. SB 610 amended the Water Code to expand the types of information included in Urban Water Management Plans (UWMP) from Water Code Section 10620 *et seq.* and to amend Water Code Part 2.10 Water Supply Planning to Support Existing and Planned Future Uses (Section 10910 *et seq*.). The latter Part 2.10 describes the roles and

[2] Water year is the period from October 1 to September 30, named for the calendar year on September 30.

responsibilities of the Lead Agency under CEQA and the public water system (water supplier) with respect to comparing current and future water supplies with current and projected future water demands. A project requiring a WSA, as defined in SB 610, includes 1) a proposed residential development having more than 500 dwelling units; 2) a proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space; 3) a proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space; 4) a proposed hotel or motel, or both, having more than 500 rooms; 5) a proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area; 6) a mixed-use development that includes one or more of the uses described above; 7) a development that would demand an amount of water equivalent to or greater than the amount of water required by a 500-dwelling-unit project; and 8) for Lead Agencies with under 5,000 water service connections, any new development that will increase the number of water service connections in the service area by ten percent or more.

If the water supplier has already completed an UWMP, it must identify whether the new demands are included in the UWMP. If the UWMP includes the demands, it may be incorporated by reference. In this case, there is no UWMP covering the Project Area; therefore, Water Code Section 10910 requires the preparation of a WSA. To comply with the SB 610 requirements, this WSA includes the following information:

- A description of the water service area including climate and population. Population information include current and projected population reflecting existing and planned future populations.
- A description and quantification of the existing and planned water sources (surface water, groundwater, and recycled water).
- A description of the water source availability during normal, single-dry, and multiple-dry water year types.
- A description of current and projected water demands among all user classes in the future public water system service area in five-year increments.
- A discussion of the total projected water supplies determined to be available to the Maha Resort water system during normal, single-dry, and multiple-dry water years for a 20-year horizon that will meet the projected water demand associated with the proposed project, in addition to continuation of existing uses and planned future uses.

WSA requirements are specified when groundwater is identified as a source. For the Project Area, groundwater is planned to serve as the sole source of potable drinking water and delivered surface water will provide agricultural and landscaping water demands. Due to the inclusion of groundwater as a source of water, the WSA must include the following additional information:

- A review of any information contained in an UWMP relevant to the identified water supply for the proposed project. Where an area does not have an UWMP, a guidance document prepared

by the California Department of Water Resources (DWR) suggests that the WSA include discussion of any existing groundwater management plan and how it would affect the water supplier's use of the basin (DWR, 2003).

- A description of any groundwater basin from which the proposed project would be supplied with groundwater, including information obtained from the most current DWR bulletin that characterizes the condition of the groundwater basin (i.e., whether DWR has identified the basin as overdrafted, or projected that the basin will become overdrafted if present management conditions continue, and what measures are being taken to prevent overdraft conditions from occurring). As suggested in the DWR guidance document relating to the implementation of SB 610, if the basin has not been (or recently been) evaluated by DWR, data that indicate historical and recent groundwater level trends should be evaluated.
- A detailed description and analysis of the amount and location of groundwater pumped by the public water system for the past five years from any groundwater basin from which the proposed project will be supplied.
- A detailed description and analysis of the amount and location of groundwater that is projected to be pumped (for at least a twenty-year horizon) by the public water system from any basin from which the proposed project will be supplied.
- An analysis of the sufficiency of the groundwater that will be supplied from the basin or basins to meet the projected water demand of the proposed project.

1.6 Definition of Terms

1.6.1 Project Area

The Project Area covers approximately 16,000 acres of unincorporated land in southern Lake County and includes the lands to be rezoned and developed as part of the Project (**Figure 1-1**).

1.6.2 Adjacent Non-Project Areas

Adjacent Non-Project Areas are lands that rely on surface water and groundwater water supplies available to meet Project demands. Due to the shared sources of supply these areas are included in the analysis presented in this WSA. These areas include approximately 505 acres along Bucksnort Creek in Guenoc Valley, including an existing commercial winery, and approximately 720 acres in Napa County (**Figure 1-1**).

1.6.3 Sufficiency

Water Code Section 10910(f)(5) requires inclusion of "an analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project."

Water Code Section 10910(c)(3) states:

> "If … the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses."

The Water Code Sections (Water Code 10910 *et seq*.) above are understood to mean that the analysis of the sufficiency of groundwater from the basin applies to the availability of water supplies to meet the projected water demands during normal, dry, and multiple-dry years within a 20-year projection.

1.6.4 Overdraft

SB 610 requirements discussed above include evaluation of the condition of the groundwater basin, including whether DWR has identified the basin to be in overdraft or projected to become overdrafted. The word "overdraft" is defined by DWR as follows (DWR, 2003a):

> "[T]he condition of a groundwater basin or subbasin in which the amount of water withdrawn by pumping exceeds the amount of water that recharges the basin over a period of years, during which the water supply conditions approximate average conditions (DWR, 1998)."

Bulletin 118 also reports that "overdraft can be characterized by groundwater levels that decline over a period of years and never fully recover, even in wet years. If overdraft is determined and continues for a number of years, "significant adverse impacts may occur, including increased extraction costs, costs of well deepening or replacement, land subsidence, water quality degradation, and environmental impacts" (DWR, 2003a).

1.7 Water Management Plans

This section includes a review of existing Water Management Plans that are in the vicinity of the Maha Resort Project area and how they pertain to groundwater resources in the area. This includes the Lake County Groundwater Management Plan (CDM, 2006).

There are no Urban Water Management Plans or Agricultural Water Management Plans for areas intersection of overlapping with the Project area.

Lake County manages groundwater resources through the Lake County Watershed Protection District (District). In 2006, the District finalized the Lake County Groundwater Management Plan (GMP) (CDM, 2006). The GMP was developed to "(support) the long-term maintenance of high quality groundwater resources within the 13 groundwater basins of the county" (p. 1-3), including the Coyote Valley Basin and Collayomi Valley Basin. The GMP includes the following management objectives:

- Improve the understanding of groundwater hydrology and quality in Lake County;

- Maintain a sustainable, high quality water supply for agricultural, environmental, and urban uses;
- Minimize the long-term drawdown of groundwater levels;
- Protect groundwater quality;
- Minimize changes to surface water flows and quality that directly affect groundwater levels or quality;
- Minimize the effect of groundwater pumping on surface water flows and quality;
- Facilitate groundwater replenishment and cooperative management projects; and
- Prevent inelastic land surface subsidence from occurring as a result of groundwater pumping.

The GMP presents information summarizing groundwater conditions in each basin including hydrographs of depth to groundwater in the northern portion of the Coyote Valley which established historical groundwater levels. The GMP also includes the following "Best Management Objectives" (BMOs), developed with stakeholder input, to guide groundwater management in the Coyote Valley Basin and Collayomi Valley Groundwater Basin:

- Prevent long-term declines in groundwater levels
- Maintain groundwater levels to assure an adequate and affordable irrigation and domestic water supply
- Develop an understanding of groundwater within the basin
- Maintain a sustainable water supply now and into the future
- Understand geothermal water occurrence
- Reduce nitrate concentrations
- Increase groundwater quality monitoring
- Increase monitoring and understanding of groundwater levels, groundwater quality, land subsidence, and connections between these elements
- Monitor and understand iron, manganese, boron and chromium water quality issues Understand well depths consistent with basin pumping or available yield
- Increase subsidence monitoring
- Prevent inelastic land subsidence

Both the Coyote Valley Groundwater Basin and the Collayomi Valley Groundwater Basin are designated as very low priority basins by the California Department of Water Resources as of 2019. Based on their priority designation, the basins are not required to be managed by a Groundwater Sustainability Plans (GSPs), under the Sustainable Groundwater Management Act. No Groundwater Sustainability Agencies (GSAs) have formed within either basin.

1.8 Water System Permits, Regulatory Requirements, and Approvals

The Project will be required to obtain permits and regulatory approvals from design to construction and including ongoing operations. Permits and regulatory approvals related to the Project water system are listed below, along with the corresponding regulatory agency:

- Water Wells Permits – Issued by Lake County or State Water Resources Control Board – Division of Drinking Water(SWRCB-DDW)
- Water System Plan and Technical Reports - Approved by Lake County and SWRCB-DDW
- Operation and Maintenance Plan - Approved by Lake County and SWRCB-DDW
- Water System Permit - Issued by SWRCB-DDW
- Public Water Utility Formation - Approved by the CPUC, Lake County Local Agency Formation Commission, and SWRCB-DDW
- Water Recycling Permit -Issued by the Central Valley Regional Water Quality Control Board (with review by the SWRCB-DDW)

2 MAHA RESORT AT GUENOC VALLEY SETTING

Guenoc Valley is a small inland valley set on an alluvial fan, isolated from surrounding areas by rocky ridges and volcanic outcroppings and rock. As part of the inner coastal range of Northern California, the site is characterized by varied topography, with rolling hills, native vegetation including chaparral and oak woodlands, irrigated vineyards, grazing corridors, open meadows and lakes. Ground elevations across the Project Area range from 600 to over 1,200 feet above sea level.

The Project Area is approximately 95 miles northeast of San Francisco, 85 miles southwest of Sacramento, 40 miles east of Santa Rosa, and 25 miles southeast of Clearlake.

2.1 Project Area Characteristics

The Project Area covers approximately 16,000 acres of unincorporated land in southern Lake County. Adjacent Non-Project Areas include an additional 1,225 acres in unincorporated Lake and Napa Counties that share existing water supplies with the Project Area, including surface water diversions and groundwater, described in more detail in the following sections. The Project Area and Adjacent Non-Project Areas support agricultural land uses along with a winery and tourism-focused uses, including a hunting lodge and camp. A golf course was also in use on the Project Area until approximately 2016.

The surrounding area is predominately rural and characterized by some agricultural uses and scattered small communities, with native vegetation predominating. Two communities located near the Project Area include Middletown, located approximately three miles west via Butts Canyon Road and Highway 29 (**Figure 1-1**).

2.2 Climate and Precipitation

The Project Area experiences a Mediterranean climate, characterized by a wet season occurring during cool winters and dry season during the warm to hot summers (**Figure 2-1**). Monthly average high temperatures range from 58 °F in December to 88 °F in July. Monthly average low temperatures range from 35 °F in December to 64 °F in July. Precipitation measured at a long-term station in Middletown has averaged 41 inches annually for the most recent 30-year period, from 1989. The distribution of annual precipitation, evaluated by a frequency analysis, includes a range of normal year precipitation from 35 inches to almost 54 inches (**Table 2-1**).

Table 2-1: Middletown Precipitation Frequency Analysis

Class	Lower Bound (inches)	Upper Bound (inches)	Number of Years	Exceedance Probability	Likelihood
Very Dry		<=29.37	5	89.80%	10.4%
Dry	29.38	34.98	11	67.35%	22.9%
Normal	34.99	53.61	17	32.7%	35.4%
Wet	53.62	75.45	11	10.2%	22.9%
Very Wet		>75.45	4	*<10.2%*	8.3%

Station ID: USC00045598, 1941 to 2017, n=48, excludes years with incomplete data

2.3 Current and Projected Population

There are currently no permanent residences in the Project Area and no residences at the Off-site Workforce Housing site location in Middletown, as a result the population of both areas is zero. The estimated project area population is expected to reach 1,059, including resort residential and hotel units and workforce housing. Future Phases are expected to add a population of 2,790. Off-site workforce housing, planned to be located in Middletown, is projected to reach a population of 221. In total, after full build-out the Project is estimated to account for a population of 4,070 (**Table 2-2**).

Table 2-2: Estimated Project Population

Location	Residential Units	Workforce Bedroom Units	Population Generated
Project Area Phase One	401	100	1,059
Project Area Future Phases	1,000	400	2,790
Off-site Workforce Housing	-	221	221
Total	**1,401**	**721**	**4,070**

Adapted from AES (2019). Population estimated based on proposed residential units.

2.4 Existing and Planned Water Sources

2.4.1 Groundwater

Fourteen springs and production wells are currently in use in the Project Area and Adjacent Non-Project Areas (**Table 2-3**). Wells supply irrigation water outside of approved Places of Use and domestic water for existing uses. At least eight springs, not shown in **Table 2-3**, were formerly used for stock watering. Two springs are currently used to supply domestic uses, though none are proposed to supply Project water demands. Two wells shown in **Table 2-3** (McCreary Production Well 1 and Red Hills Production Well 1) are proposed wells planned to be constructed, under and existing contract for drilling services.

In the Project Area, three wells are currently used to meet existing uses and are not planned to supply Project demands. These include the Lodge Well, Tephra Ridge #1 Well, and Tephra Ridge #2 Well (**Table 2-3**). The Lodge Well supplies domestic uses at the Gebhard Lodge with production rate of about 10 gallons per minute (GPM) (AES, 2006). The two Tephra Ridge wells supply groundwater to meet irrigation demands at the Tephra Ridge vineyards located approximately 2 miles southeast of Detert Reservoir and outside of surface water Places of Use. The Tephra Ridge irrigation wells have approximate production rates of 50 GPM and 25 GPM, respectively (**Table 2-3)** (AES, 2006).

In preparation for the Project, new water supply wells have been constructed in the Project Area to eventually supply groundwater to the two planned potable water systems. Work related to the installation of the water supply wells began in August of 2019. A total of four potable water supply wells are currently planned to be installed (**Figure 2-3**). As of November 2019, two wells (Camping Area Production Well 1 and Farmstead Production Well 1) have been installed and a third well is under construction. New wells have been constructed and tested to municipal standards and will be able to be permitted domestic supply wells. Initially, the wells will be used to supply water for construction activities.

Camping Area Production Well 1 (CA PW-1)[3]

Construction and testing of CA PW-1 began in September 2019 and was completed in October 2019. A conductor consisting of 24-inch diameter by 5/16-inch wall mild steel was installed from 50 feet below ground surface (bgs) to ground surface within a 30-inch diameter borehole. A sanitary seal consisting of a 10.3 sack sand/cement grout was placed in the annulus between the borehole and the casing. The 17-inch diameter borehole was drilled from 50 feet bgs to 290 feet bgs. The materials encountered during the drilling of CA PW-1 included sand and gravel and fractured volcanic rock. The well structure consists of 8-inch diameter by ¼-inch wall mild steel blank and triple mill slotted steel casing. The width of slots is 0.080-inch. Slotted intervals were installed from 110-170, 180-240, and 250-270 feet bgs. A well sump was installed from 270-280 feet bgs. A gravel pack consisting of pea gravel was installed from 290 to 100

[3] Camping Area Production Well 1 (CA PW-1) was previously designated Wilderness Area Production Well 1 (WA PW-1). The well has been renamed to more closely align with the proposed Project elements. The latter name still appears in some earlier Project documents including water quality sampling documentation.

feet bgs. An annular seal consisting of 10.3 sack sand/cement grout was installed from 100 feet bgs to ground surface.

Testing of WA PA-1 consisted of three, 2-hour constant rate tests, followed by a 10-day constant rate test. The short-term constant rate tests (i.e., step tests) were used to select a pumping rate for the 10-day constant rate test. During short-term testing the well was pumped at 160 GPM, 240, GPM, and 377 GPM, respectively (**Figure 2-4**). Afterwards, the well was pumped at an average rate 346 gallons per minute (GPM) for 10-days (**Figure 2-5**). Total drawdown during the constant rate test was approximately 28 feet at the maximum pumping rate allowed by the test pump. At the end of the test, the well's specific capacity was 12.7 gallons per minute/foot of drawdown (GPM/foot). Water level measurements were collected for 10 days after pumping ceased. The water level within the well recovered to within 95% of the static water level within 8 days. Based on the pumping rate and rate of water level recovery, per DDW regulations (CCR Section 64554), the permitted yield of the well is anticipated to be 178 GPM. The pumping rate used during the test was limited by the size of the installed pump. A higher well yield could be demonstrated with additional testing with a larger pump. Water quality samples were collected during the constant rate test for Title 22 drinking water analysis. For the constituents analyzed, the water meets all current Title 22 water quality standards (**Table 2-4).**

Farmstead Production Well 1 (FS PW-1)

Construction and testing of FS PW-1 began in October 2019. A conductor consisting of 24-inch diameter by 5/16-inch wall mild steel was installed from 50 feet bgs to ground surface within a 30-inch diameter borehole. A sanitary seal consisting of a 10.3 sack sand/cement grout was placed in the annulus between the borehole and the casing. The 17-inch diameter borehole was drilled from 50 feet bgs to 430 feet bgs. The material encountered during the drilling of FS PW-1 was fractured volcanic rock. The completed well depth is 430 feet below ground surface bgs, with screened intervals of 200-300 and 330-420 feet bgs. The well casing consists of 8-inch diameter by ¼-inch wall mild steel installed within a 17-inch diameter borehole. The well screen is triple mill slot with 0.080-inch slot size. The gravel pack consisting of pea gravel is installed from 430 to 100 feet bgs. An annular seal consisting of 10.3 sack sand/cement grout is installed from 100 feet to ground surface.

Testing of FS PW-1 began in November 2019. The initial phase of yield testing consisted of three, 2-hour constant rate tests, followed by a 10-day constant rate test. The short constant rate tests were used to select a pumping rate for the 10-day constant rate test. The well was pumped at an average rate of 305 GPM during the 10-day test. Water quality samples were collected during the constant rate test for Title 22 drinking water analysis. For the constituents analyzed, the water meets all current Title 22 water quality standards (**Table 2-4**). Water level and pumping rate data are being evaluated to quantify the anticipated permitted well yield for FS PW-1.

Four production wells and springs are located in Adjacent Non-Project Areas and are not proposed to supply the Project; they include the Headquarters West #1 and #2 springs, Langtry Estates Well, and the Upper Bohn Well (**Table 2-3**). The Headquarters West #1 and #2 springs supply domestic uses at the

Lillie Langtry House and nearby buildings. The Langtry Estates Well supplies the existing winery and tasting room located near the intersection of Guenoc Road and Butts Canyon Road. The Upper Bohn Well is located outside of the Project Area, in Napa County, and supplies existing agricultural water demands in the Project Area and adjacent non-project areas. The Upper Bohn Well is located approximately one-half mile southeast of Upper Bohn Lake. Constructed in 2002, the Upper Bohn Well is pumped into Upper Bohn Lake to augment the primary supply of surface water to the lake, as needed to supply irrigation demands for vineyards located outside of Places of Use in the Upper Bohn Lake service area. The Upper Bohn Well is not proposed to supply the Project and no changes to the use or volume of pumpage are anticipated as a result of the Project.

Crossroads Well (W-1)

The Crossroads Well was constructed in 2002 and tested soon afterwards at a rate of 295 GPM for 24-hours (GSi/water, 2002). In their report describing that testing, GSi/water described that an average pumping rate of 300 GPM could be used, but that a long-term production rate may need to be set lower to allow for more complete water level recovery between pumping cycles. As shown in **Table 2-3**, the long-term pumping rate is estimated to be 200 GPM.

Table 2-3: Well and Spring Inventory

Well or Spring Name	Approximate Production Rate (Gallons per Minute)[1]	Purpose/Use	Planned to Supply Project
Crossroads Well (W-1)[2]	200	Upper Bohn Area Non-Potable Supply	Yes
Camping Area Production Well 1 (CA PW-1)	178	Guenoc Valley and Camping Area Potable Supply	Yes
Farmstead Production Well 1 (FS PW-1)	Analysis pending	Upper Bohn Area Potable Supply	Yes
McCreary Production Well 1 (McCreary PW-1)	Well construction and testing pending	Guenoc Valley Area Potable Supply, not yet constructed	Yes
Red Hills Production Well 1 (RH PW-1)	Well construction and testing pending	Upper Bohn Area Potable Supply, not yet constructed	Yes
Lodge Well	10	Gebhard Lodge domestic use	No
Tephra Ridge #1 Well	50	Tephra Ridge vineyard irrigation	No
Tephra Ridge #2 Well	25	Tephra Ridge vineyard irrigation	No
Langtry Estates Well	unknown	Langtry Estates Winery	No
Headquarters West #1 Spring	15	Langtry House and nearby buildings domestic use	No
Headquarters East #1 Spring	5	Langtry House and nearby buildings domestic use	No
Upper Bohn Well (W-2)[2]	540	Upper Bohn Area Non-Potable Supply	No
Langtry Vineyard #1 Spring	5	Langtry Vineyard irrigation use	No
Lodge Well	10	Gebhard Lodge domestic uses	No
Black Oak Villa Spring	1	Domestic uses	No
Ink Ranch Spring	2	Existing hunting camp supply	No

[1] Table adapted from (AES, 2006, p.4.5-5). Spring and well production rates may vary seasonally and annually. Production rates are estimates unless stated otherwise.
[2] Alternate names as designated by GSi/water (2002).

2.4.2 Surface Water

A number of intermittent streams run through the Project Area and one perennial stream, Putah Creek, crosses the northeast part of the Project Area. Bucksnort Creek enters the property near the southwest corner of the property and lows in a southeast to northwest direction approximately 7 miles through the property before discharging into Putah Creek. Bucksnort Creek is an important stream on the property and is used to convey water from one reservoir to another on a periodic basis. Putah Creek runs approximately 6.7 miles through the property and drains into Lake Berryessa, southeast of the Project Area. Several of the intermittent streams have been dammed to create reservoirs for water storage used pursuant to existing surface water rights.

The Project has existing riparian and appropriate water rights that allow for the diversion and use of surface water resources. Riparian water rights permit the landowner to use water on riparian land for domestic, stock watering, irrigation, power and other beneficial purposes. The riparian right is not based on the amount of use and is not lost by non-use. Riparian rights only allow for the direct diversion of water and do not allow for storage of water typically greater than 30-days. The long-term irrigation and frost protection of lands on the property require the reliability of seasonal water storage allowed by appropriative rights.

Appropriative rights allow a specific amount of water to be diverted and used for reasonable, beneficial use in a specific place (defined as a "place of use" (POU). Appropriative rights allow for direct diversion and/or storage of water for use on lands regardless of their proximity to streams. The appropriative right relates to the particular amount of water, and failure to make use of the right over five consecutive years can results in the forfeit of the right. It is also important to note that appropriative water can be applied to non-POU lands within a water year, as long as the water used is replenished from an alternative water supply, such as from a groundwater source.

The appropriative water rights for the Project Area and Adjacent Non-Project Areas allow for the diversion to storage of 10,394.5 acre-feet per year (AFY) and withdrawals from storage of up to 8,599.5 AFY (**Table 2-5**). The current storage capacity of reservoirs is 9,390 acre-feet (**Table 2-6**). The Project has the capacity, using existing infrastructure, to transfer water from storage in reservoirs in the Bucksnort Creek watershed (i.e., Langtry, Detert, Bordeaux, Burgundy, and McCreary) to Upper Bohn Reservoir outside of the Bucksnort Creek watershed. These transfers allow greater flexibility in the use of available surface water, consistent with appropriative rights. Previously permitted modifications to Upper Bohn Lake, scheduled for completion in 2020, are planned to increase the net storage capacity of that reservoir by 1,000 acre-feet and facilitate increased diversions to storage in Upper Bohn Lake from Putah Creek by up to 1,600 acre-feet per year. As a result of these modifications, the planned future storage capacity of Project Area reservoirs will be 10,390 acre-feet.

Table 2-5: Langtry Farms/Maha Resort at Guenoc Valley Appropriative Water Rights Summary

Water Right	Reservoir	Authorized Diversion to Storage Amount (AFY)	Authorized Withdrawal from Storage Amount (AFY)
Reservoirs Serving the Project Area			
License 2141 (Application 3069)[1]	Detert, McCreary, Lake Bordeaux (Foley No. 1), Lake Burgundy (Foley No, 2) & Bucksnort Creek Diversion Dam	6,074.5	5,089.5
License 2142 (Application 4889)			
License 6334 (Application 15706)			
License 10421 (Application 19890)			
License 10422 (Application 20877)			
Pending License under Permit 16861 (Application 24297)[2]

Permit 16860C (Application 24296C)			
	Totals	**10,394.5**	**8,599.5**
Storage Reservoirs Supplying Other Areas			
License 13414 (Application 24296B)	Big Basin Reservoir (Napa Valley Lake)	200	192

Adapted from Wagner & Bonsignore (2019)
[1] Water right License 2141 (Application 3069) also authorizes direct diversion of 5.35 cfs from Bucksnort Creek.
[2] Diversion and storage of 985 ac-ft of water was perfected prior to the end of the beneficial use period of Permit 16861 and was inspected for license by the SWRCB. No withdrawal from storage was made prior to the end of the beneficial use period of Permit 16861 therefore no withdrawal from storage of this 985 ac-ft of water will be authorized by the pending license.
[3] The storage and withdrawal amounts stated for Permits 16861 are amounts which were perfected prior to the end of the beneficial use period of the Permit and were inspected for license by the SWRCB. (*Continued)*

[4] The diversion to storage and withdrawal amounts stated for Permits 16860A are amounts which were perfected prior to the end of the beneficial use period of Permit 16860A and were inspected for license by the SWRCB.

Riparian rights allow for the direct diversion of 5.35 cubic feet per second (cfs) for use on lands along Bucksnort Creek in Guenoc Valley. Between 1999 and 2018 the average annual estimate of riparian water use by existing Project Area and Adjacent Non-Project Areas has been 560 AFY (Wagner & Bonsignore, 2019).

Table 2-6: Langtry Farms/Maha Ranch at Guenoc Valley Storage Reservoirs

Reservoir Name	Stream	Storage Capacity (Acre-feet)
Storage Reservoirs Serving the Project Area		
Detert Lake (Guenoc Lake)	Bucksnort Creek	3,220
McCreary Lake	Bucksnort Creek	1,725/2,098[1]
Lake Bordeaux (Foley No. 1)	Unnamed	540
Lake Burgundy (Foley No. 2)	Unnamed	212
Cassidy Lake (Langtry Lake)	Unnamed	560
Upper Bohn Lake	Routan Creek and Unnamed	2,760[2]
	Total Storage Capacity	9,017/9,390
Storage Reservoirs Supplying Other Areas		
Big Basin Reservoir (Napa Valley Lake)	Unnamed	200

Adapted from Hanson (1999)
[1] The capacity of McCreary Lake is increased to 2,098 acre-feet with flashboards installed.
[2] Previously permitted modifications to Upper Bohn Lake, scheduled for completion in 2020, are planned to increase the net storage capacity by 1,000 acre-feet.

2.4.3 Recycled Water (Non-potable)

Recycled water is a planned source of supply to the Project. The Project proposes that new development clusters will be connected to new sanitary sewer systems and conveyed to new wastewater treatment facilities designed to produce non-potable recycled water suitable for reuse as landscaping irrigation and make up water for ornamental ponds and water features (Sherwood Design Engineers, 2019b).

2.5 Current Land Use

The Project Area and Adjacent Non-Project Areas support agricultural land uses along with a winery and tourism-focused uses, including a hunting lodge and camp. Agricultural and hunting uses have been a feature of the Project Area for over a hundred years and represent the most extensive of currently developed land uses in the Project Area. Since 2016 agricultural acreage consists of approximately 1,660 acres of vineyards, though prior to 2015 several hundred acres of pasture were also irrigated. Agricultural acreage currently includes minor areas within and outside of Places of Use associated with existing surface water rights (**Table 2-7).** Most of the existing agricultural uses rely on a combination of groundwater and surface water (through appropriative and riparian rights) described in Section 4 of this WSA.

Although a few rural residential properties are present in the Project Area and Adjacent Non-Project Areas, current domestic uses are limited. Residences are present in the main ranch center, located along Guenoc Road near Bucksknort Creek, includes the 19th century home of Lillie Langtry, and a guest house, both of which are in the Adjacent Non-Project Areas. An older ranch home located of the northeast of the ranch center, and within the Project Area, is used infrequently as a guesthouse and hunting lodge. The Adjacent Non-Project Areas also include the Langtry Estates Winery and tasting room facility.

Table 2-7: Current Agricultural Land Use

Use	In Places of Use (Acres)	Outside Places of Use (Acres)
Project Area - Vineyard	860	105
Adjacent Non-Project Areas -Vineyard	745	-
Total	1,605	105

3 HYDROGEOLOGIC SETTING

3.1 Geologic Setting

Lake and County is located within the California Coast Range geomorphic province. This province is a geologically complex and seismically active region characterized by sub-parallel northwest-trending faults, mountain ranges and valleys. The oldest bedrock units are the Jurassic- Cretaceous Franciscan Complex and Great Valley sequence sediments originally deposited in a marine environment. Subsequently, younger rocks such as the Tertiary-age Sonoma Volcanics group, the Plio-Pleistocene-age Clear Lake Volcanics and sedimentary rocks such as the Guinda, Domengine, Petaluma, Wilson Grove, Cache, Huichica and Glen Ellen formations were deposited throughout the province. Extensive folding and thrust faulting during late Cretaceous through the early Tertiary period created complex geologic conditions that underlie the modern topography (**Figure 3-1**). In valleys, the bedrock is covered by alluvial soil of variable thickness.

The Project Area is underlain by Quaternary terrace deposits and olivine basalt, as well as older units such as Cretaceous-Jurassic Franciscan sandstone, shale, mélange, serpentinite, and greenstone. There are also localized outcrops of Cretaceous-Jurassic Great Valley Sequence and Jurassic Knoxville Formation.

Alluvial deposits occur along Bucksnort Creek, Putah Creek and in some smaller drainages in the Project Area. Alluvial deposits, including sands and gravels, occur at thicknesses of 5-15 feet along Bucksnort Creek and in other larger drainages in the Project Area. Groundwater Basin Description

While 91% of the Project Area acreage is outside of groundwater basins designated by the California Department of Water Resources (DWR), the Project Area does include approximately 1,340 acres within the Coyote Valley Groundwater Basin (8% of the total Project Area) and approximately 90 acres within the Collayomi Valley Groundwater Basin (less than 1% of the total Project Area) (**Figure 1-1**).

DWR identifies the alluvial plain of the Coyote Valley Basin as bounded on the west and northwest by Franciscan and undifferentiated rocks (DWR, 2004). The south and southwest part of the valley is bounded by low hills of basalt outcrops. North of the Basin there are outcrops of Cache Formation, to the northeast there is more basalt. The Basin's primary water bearing formation are alluvial deposits comprised of floodplain and channel deposits from Putah Creek and alluvial fan deposits. DWR reports that water bearing alluvium ranges in thickness from 100 to 300 feet. Volcanics, including the Cache Formation on the north, may be water bearing. Major recharge to the Coyote Valley Groundwater Basin is from Putah Creek, with lesser recharge from direct precipitation onto the alluvium and from smaller streams.

3.2 Well Yields and Aquifer Characteristics

DWR reports that well yields for municipal and irrigation wells in the Coyote Valley Basin range from 75 to 800 gallons per minute (GPM), with an average of 446 GPM recorded on six well completion reports.

Well yield information available from the Project Area indicates somewhat more permeable formations, including the Clear Lake Volcanics Formation are present in the northern and eastern Project Area, including areas adjacent to Upper Bohn Lake extending northward to Amel Lake (**Figure 3-1**). These areas include existing wells planned to be among the wells suppling the Project including the Crossroads well, Camping Area Production Well 1, and Farmstead Production Well 1. Additional supply wells planned to be constructed to supply the Project, including Red Hills Production Well 1 and McCreary Production Well1, are also proposed to be located within the Clear Lake Volcanics Formation. As described in Section 2.4.1, yields at the two presently constructed and tested wells planned to supply the Project are between 178 GPM and 200 GPM.

4 CURRENT AND HISTORICAL WATER DEMANDS AND PROJECTED AVAILABILITY

This section summarizes available data and to describe current and historical water demands and availability by source of supply. This section also describes anticipated availability of water supplies by source using a variety of data including historical records of surface water availability, mathematical modeling of groundwater availability, and planned recycled water availability.

4.1 Groundwater Use and Availability

4.1.1 Groundwater Levels

Long-term groundwater level data in the Project Area is limited, at present. The nearest well with notable water level history is located at the border of the Project Area, where it overlaps the Collayomi Valley Basin. Additional information on groundwater trends within the area can be inferred from the surrounding groundwater basins which have long monitoring histories. These basins are the Coyote Valley Basin and the Collayomi Valley Basin (which extends into the study area) along Bucksnort Creek (**Figure 1-1**).

Groundwater levels in the Coyote Valley Basin are shallow in the spring, decrease over the summer, and recover during the winter. Water levels in the basin are generally between 10 to 15 feet below ground surface in the spring. Spring to summer drawdown in the western areas ranges from 20 to 25 feet, and drawdown on the eastern side of the valley ranges from 5 to 10 feet. Groundwater levels have been generally stable throughout the Basin.

Groundwater levels in the Collayomi Valley Basin follow similar trends as the Coyote Valley Basin. Water levels in the basin are shallow in the spring ranging from 3 to 15 feet below the ground surface and fluctuate in the growing season, drawing down 5 to 20 feet.

The groundwater levels monitored by a well on the southwest border of the study area are largely consistent over the period of record. Water levels remain around 5 to 10 feet below ground surface in the spring and dip to 20 to 25 feet in the summer.

4.1.2 Groundwater Quality

The groundwater quality data are also somewhat limited in the Project Area, although samples collected in 2019 during test well drilling and production well construction activities have shown generally good water quality in the areas under consideration for production wells to supply the Project. Samples from a few test well, drilled to inform siting of production wells, have contained elevated levels of barium, boron, iron and zinc, which can be easily treated for potable water. Four of the six test wells had good quality water, which met the drinking water criteria for inorganics and physical parameters. One well had high concentrations of iron and zinc, which will require treatment prior to domestic use. One well had high barium and boron, which will require treatment prior to domestic use. As noted in Section 2.4.1, water quality tested at the newly constructed Camping Area Production Well 1 and Farmstead Production Well 1 met all current Title 22 water quality standards (see **Section 2.4.1**).

4.1.3 Historical Pumpage

Groundwater has been in use in the Project Area and Adjacent Non-Project Areas for many decades. Records of pumping volumes were not made in the past, but the production capacities of wells supplying vineyards in the Tephra Ridge area and the Upper Bohn Lake service area, described in Section 2.4.1, have been tested in the past. The Tephra Ridge irrigation wells have approximate production rates of 50 GPM and 25 GPM, respectively (**Table 2-3)** (AES, 2006). The Crossroads Well was tested in 2002 at a rate of 295 GPM for 24-hours (GSi/water, 2002). In their report describing that testing, GSi/water described that an average pumping rate of 300 GPM could be used, but that a long-term production rate may need to be set lower to allow for more complete water level recovery between pumping cycles. As shown in Table 2-3, the long-term pumping rate is estimated to be 200 GPM.

DWR previously estimated the groundwater storage capacity of the entire 3,000-acre Coyote Valley Basin to be 29,000 acre-feet (AF), with usable storage capacity of 7,000 AF. DWR estimated groundwater extraction for agriculture and municipal/industrial uses in about 1995 at 1,400 AF and 290 AF, respectively, for a total use of 1,690 AF. DWR also estimated that deep percolation from applied water to be 1,100 acre-feet. In 2019, DWR finalized a groundwater use estimate as part of a statewide groundwater basin prioritization review. That 2018 basin prioritization estimate of groundwater use was 3,250 acre-feet and did not include an estimate of deep percolation of applied water (DWR, 2019).

4.1.4 Current Pumpage

Current use of groundwater in the Project Area supports domestic uses at an older ranch home used as a guest house and hunting lodge and agricultural production in areas outside of Places of Use. Use of groundwater in Adjacent Non-Project Areas supports an existing winery and domestic uses at the Langtry House (**Table 4-1**). Domestic uses, including landscape irrigation, are estimated to be 1 acre-foot per year for the existing ranch home in the Project Area and 2 acre-feet per year at the Langtry House. Winery uses are reported to range from 3,000 to 5,000 gallons per day during nine non-harvest months and 5,000 to 7,000 gallons per day during three harvest months (R. Sternberg, pers. comm.), resulting in an estimate of 6 acre-feet per year. Agricultural irrigation includes approximately 42 acres of vineyard in the Tephra Ridge area southeast of Detert Reservoir and approximately 63 of vineyard west and north of Upper Bohn Reservoir located adjacent to but outside of Places of Use. Average annual vineyard irrigation and frost protection amounts are 1 acre-foot per acre based on surface water uses for irrigation and frost protection recorded for existing uses in the Project Area (**Appendix A**).

Table 4-1: Existing Average Annual Groundwater Use

Use Type	Average Annual Use by Year (Acre-feet)	
	2009 - 2013	2014- 2019
Potable		
Project Area – Guest house/hunting lodge (occasional domestic use and landscape irrigation)	1	1
Adjacent Non-Project Areas – Langtry House (domestic uses and landscaping)	2	2
Adjacent Non-Project Areas - Langtry Estates Winery	6	6
Potable Groundwater Use Subtotal	9	9
Non-Potable		
Project Area: Tephra Ridge Vineyard Irrigation and frost protection (42 acres)	42	42
Adjacent Non-Project Areas – Upper Bohn area vineyard outside Places of Use (63 acres)	-	63
Non-Potable Groundwater Use Subtotal	**42**	**105**
Existing Groundwater Use	**50**	**113**

Domestic uses include landscaping demands.

Winery use is as reported by Randy Sternberg, Lotusland Investment Holdings VP, personal communication 10/3/2019.

Vineyard irrigation uses are 1 AF/acre consistent with reported deliveries of surface water metered in Project reservoirs.

Groundwater use for vineyard irrigation in the Adjacent Non-Project Areas is due to new vineyard acreage planted in those areas that are also outside of approved Places of Use for surface water.

4.1.5 Current and Projected Groundwater Availability

Current and projected future groundwater availability were evaluated for this WSA using the Basin Characterization Model (BCM) of California developed by the U.S. Geological Survey (USGS) (Flint et al., 2013). The BCM simulates watershed hydrologic processes from 1900 to 2016 for monthly time steps based on observed precipitation, potential evapotranspiration, soil survey data, and geologic conditions. The BCM is parameterized and run for a continuous state-wide model grid with cell sizes of 270 m by 270 m, or approximately five acres. The hydrologic processes simulated by the BCM are described by

Flint et al. (2013) and summarized in **Figure 4-1**. BCM outputs include surface water runoff and groundwater recharge[4] for each month for each model grid cell.

BCM model grid cell outputs for long-term average annual results are presented in **Figure 4-2** and **Figure 4-3** to depict how the outputs vary across the Project Area.

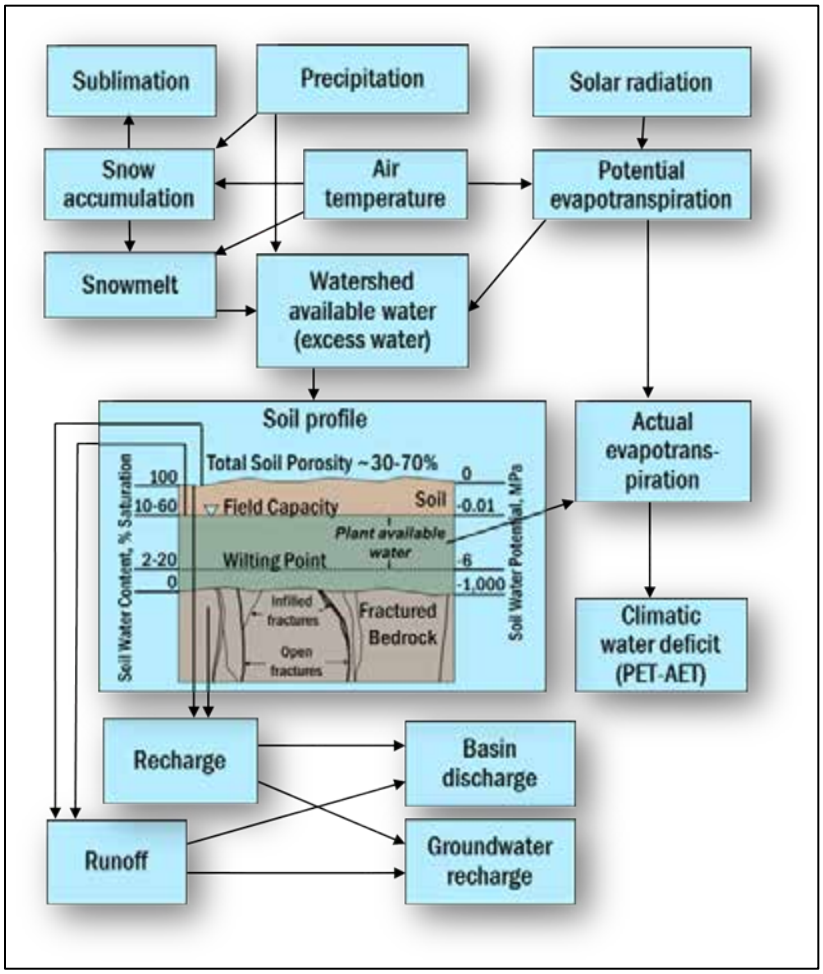
BCM results for groundwater recharge and runoff were post-processed to calculate the availability of groundwater across the Project Area for both observed current conditions and projected future conditions. The post-processing routine requires aggregating both BCM output datasets, for model cell groundwater recharge and surface runoff, and applying a series of equations that account for hydrologic processes occurring across the landscape scale that influence how streamflow is generated and how groundwater is retained in the subsurface. The conceptual model for those landscape scale process is depicted in **Figure 4-4**.

The BCM conceptual model includes three zones[5], depicted in **Figure 4-4 (**Flint et al., 2013):

1. Surface zone – "surface and near surface processes that hold and direct water toward the stream and that are event driven"
2. Shallow zone – "the shallow transient saturated zone that rises and falls seasonally providing much of the baseflow, but can sometimes also be event driven, and provides some recession flow"
3. Deep zone – "the regional aquifer but can also provide some flow to the shallow groundwater (zone) over long time frames

[4] The BCM output for groundwater recharge is consistent with the concept of deep percolation below the root zone and at a depth where evapotranspiration would not occur.
[5] The text by Flint et al. (2013) uses the term "reservoirs" to describe the three conceptual partitions of the surface water and groundwater system. This report refers instead to "zones" or "groundwater zones" to avoid confusion with discussion about surface reservoirs elsewhere in the report.

Figure 4-1: Schematic of hydrologic processes simulated by the Basin Characterization Model (adapted from Flint et al. 2013)



Post-processing BCM outputs occurs by applying a series of equations developed by the BCM authors. These equations use the model cell outputs for runoff and recharge to account for how water that becomes runoff or recharge at the model cell level eventually contribute to streamflow generated at the watershed scale, both by direct surface runoff and by contributions to streamflow by groundwater. The BCM is calibrated through this procedure to match observed streamflow at gauging stations and subsequently compared to observed streamflow at other gauging stations to validate the BCM performance. In the Project vicinity, the BCM authors utilized long-term stream gauge data from the USGS gauge Putah Creek near Guenoc, CA (USGS Station ID: 11453500) as one such validation gauge, where BCM model outputs were post-processed and compared to observed streamflow to evaluate the ability of the model and post-processing procedure to reflect observed streamflow.

The BCM post-processing equation are shown below (see Equations 1 – 7). They include quantification of monthly flows into each of the three groundwater zones (Surface, GWshallow, and GWdeep) by way of flowpaths defined as Surfaceflow, Shallowflow, and Deepflow.

1. $$GW_{surface(i)} = GW_{surface(i-1)} + BCM_{run(i)} - Surfaceflow_{(i-1)}$$

2. $$Surfaceflow_{(i)} = (SurfaceScaler * GW_{surface(i)})^{SurfaceExp}$$

3. $$GW_{shallow(i)} = GW_{shallow(i-1)} + BCM_{rch(i)} - shallowflow_{(i)} - deepflow_{(i)}$$

4. $$Shallowflow_{(i)} = (ShallowScaler * GW_{shallow(i-1)})^{ShallowExp}$$

5. $$Deepflow_{(i)} = (DeepScaler * GW_{shallow(i-1)})^{DeepExp}$$

6. $$Stream_{(i)} = Surfaceflow_{(i)} + Shallowflow_{(i)}$$

7. $$Discharge_{(i)} = WatBal * Stream_{(i)}$$

The equations also include seven parameters to influence the rate of flow between groundwater zones and ultimately simulate the total watershed scale of discharge observed at a gauging station. The values for each of the seven parameters are published by the USGS (Flint et al., 2013) for individual stream gauging stations selected by the USGS for evaluation. The parameter values vary from between gauging sites to reflect different watershed processes that vary with geologic settings, climatic patterns, and other watershed-scale processes that influence the movement of runoff of recharge. The analysis performed for this WSA applied the parameter values developed by the USGS for the nearest stream gauging station, Putah Creek near Guenoc, CA (USGS Station ID: 11453500) (see **Table 4-2**).

Table 4-2: Basin Characterization Model Post-Processing Parameters, Putah Creek near Guenoc, CA (USGS Station ID: 11453500) (source: Flint et al., 2013)

Parameter	Value
SurfaceScaler	1.00
SurfaceExp	0.97
ShallowScaler	1.00
ShallowExp	0.45
DeepScaler	1.00
DeepExp	0.60
WatBal	1.93

Figure 4-4: Schematic of watershed scale streamflow and groundwater process evaluated by the Basin Characterization Model (adapted from Flint et al. 2013)

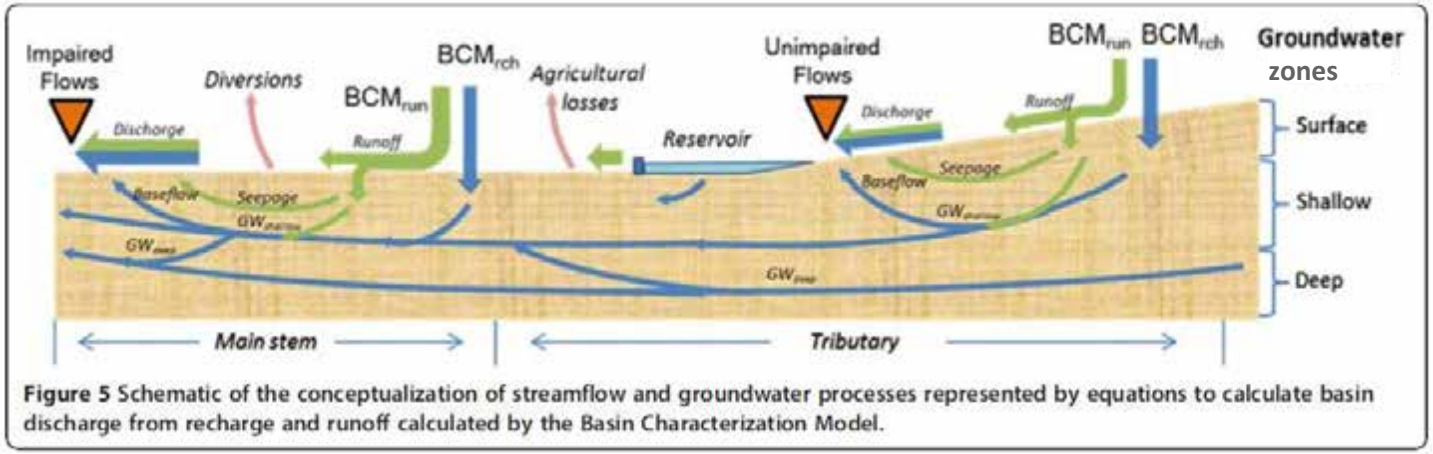


Figure 5 Schematic of the conceptualization of streamflow and groundwater processes represented by equations to calculate basin discharge from recharge and runoff calculated by the Basin Characterization Model.

Groundwater availability for the Project is represented in the post-processed BCM output for the Deepflow variable. The Deepflow reflects "water subtracted from the shallow (zone) to simulate deep groundwater recharge" (Flint et al, 2013 p. 9). This represents groundwater that moves over time through the Surface and Shallow groundwater zones simulated by the BCM and into the deep groundwater zone after accounting for flows of groundwater that contribute to streamflow as hillslope seepage (leaving the surface zone) and baseflow (leaving the shallow zone). The accumulation of water in the deep zone is therefore a subset of the overall recharge output calculated at the model grid scale and reflects an amount which is not subject to discharge through natural processes (including evapotranspiration, contributions to streamflow, and subsurface groundwater flow).

Recognizing that climate change presents the potential to alter water availability in the future, the analysis performed for this WSA incorporates a range of possible groundwater availabilities reflecting the potential for variation due to climate change. The BCM outputs provided by the USGS include projected future runoff and recharge at the model cell level developed by running the BCM with inputs for future meteorological conditions, including precipitation and air temperature, provided by global climate models (GCMs). The future conditions represented by the GCMs incorporate "global socio-economic scenarios… developed by the (United Nation's) Intergovernmental Panel on Climate Change to provide climate scenarios that take into account estimates of possible magnitudes of greenhouse gas emissions that are responsible for much of the climate change" (Flint and Flint, 2012, p 1).

The future water availability analysis performed for this WSA uses BCM outputs for a "hot and low rainfall" scenario (MIROC_esm_rcp85) developed in a recent study of climate change vulnerability in northern San Francisco Bay Area counties (Micheli et al., 2016). BCM outputs resulting from the "hot and low rainfall" scenario represents the largest departure from recent, observed climate conditions out of six future scenarios evaluated for the northern Bay Area counties. For the "hot and low rainfall" scenario mid-century averages (i.e., 2040 to 2069) include a 21% reduction in average annual precipitation, an 11% increase in minimum monthly winter temperatures, and an 8% increase in the maximum monthly summer temperatures. The monthly time scale climate scenario data and corresponding BCM outputs for runoff and recharge that the BCM simulates do not constitute "predictions of precisely when climatic events will occur" instead they represent simulated future conditions considered "physically possible given the state of the science" (Micheli et al. 2016). For this reason, the evaluation of future groundwater availability incorporates long-term average annual conditions simulated by the BCM for the Project Area.

Results of the groundwater availability analysis for current and projected future conditions in the Project Area are presented in **Table 4-3**. The results reflect the variability in groundwater flowing into the deep groundwater zone described by the BCM on an annual basis based on post-processed BCM outputs for current conditions (water years 1988 to 2016[6]) and projected future conditions (water years 2020 to

[6] The period considered to reflect current conditions reflects a recent period of balanced wet and dry water year types. BCM outputs through 2016 are the most current provided by the U.S. Geological Survey based on observed meteorological data used as inputs to the BCM. It is common for large hydrologic models, such as the BCM, to

2040) by the BCM. Current availability shown in **Table 4-3** is based on recent, observed conditions; future availability reflects projected changes resulting from the modeled climate change scenario. For the purposes of this WSA, the future groundwater supply availability is accounted for beginning in 2030, the midpoint in the 20-year period of analysis.

The amount of groundwater varies with water year conditions. Although the flow is reduced in years with reduced rainfall, one benefit of using groundwater as a source of supply is the ability to manage the use of groundwater in conjunction with other available supplies. For the proposed Project, the availability of existing surface water and future recycled water supplies provides for some flexibility in the use of groundwater for non-potable uses.

Table 4-3: Current and Projected Groundwater Supply Availability

Year Type	Normal Year	Dry Year	Very Dry Year
Current Availability (2020 – 2029)	8,700	6,570	4,800
Projected Future Availability (2030 – 2040)	6,200	4,950	3,740
Values reflect average annual inflows to the deep groundwater zone calculated by post-processing BCM model outputs for current conditions and for future conditions.			

4.2 Surface Water Use and Availability

As described in Section 2.4.2, the Project has both riparian and appropriative rights to use surface water for beneficial uses along with a series of interconnected storage reservoirs and related facilities to convey water from points of diversion to the reservoirs and then on to Places of Use. Riparian and appropriative water have been used on the property for decades and will continue to be used for beneficial uses including irrigation, frost protection, agricultural production related activities (dust control, limited construction activities), fire protection, and other acceptable uses.

Agricultural acreage includes areas within and outside of Places of Use (see Section 2.4.2). Acreage within Places of Use account for the majority of current water use and all current surface water use in the Project Area and Adjacent Non-Project Areas. Current irrigated acreage within Places of Use is approximately 1,605 acres (**Table 2-6**).[7] Total irrigated acreage outside of Places of Use is approximately

experience delays on the order of years between the time that input data become available and the time when model outputs are published.

[7] Includes areas in Adjacent Non-Project Areas of approximately 415 vineyard acres in Guenoc Valley and approximately 330 acres of existing vineyards in the Napa County in the Upper Bohn Lake service area.

105 acres in the Project Area and Adjacent Non-Project Areas (**Table 2-6**). Currently, the total irrigated acreage includes only vineyard acreage.

Prior to 2016, surface water was also used as a source of supply to irrigate a golf course, covering approximately 90 acres, and pastures covering approximately 340 acres.

Average annual surface water use in the Project Area and Adjacent Non-Project Areas was 1,400 acre-feet between water years 2009 and 2013 when the uses included irrigation for vineyard, pasture, and golf course (**Table 4-4**). Average annual surface water use was 1,060 acre-feet between water years 2014 and 2018 as the uses of irrigation transitioned to vineyard only.

Table 4-4: Existing Project Area Average Annual Surface Water Use

Use Type	Average Annual Use by Year (Acre-feet)	
	2009 - 2013	2014- 2018
Non-Potable		
Irrigation Use (Agriculture and Golf Course)	1,400	1,060
Reservoir Losses (evaporation and seepage)	2,320	2,770
Average Annual Surface Water Use and Losses	3,720	3,830
Irrigation uses and reservoir losses reported through 2018 by Wagner and Bonsignore Consulting Civil Engineers and include reservoir losses to evapotranspiration and seepage.		

In dry years, including dry and very dry years, the Project can experience reduced surface water availability, although carryover of water stored in Project reservoirs in prior years can allow the project to beneficially use more water than is diverted in a given dry or very dry year. Water use and reservoir storage records, as available, for the recent period from water year 2011 through water year 2018 were reviewed to understand how the availability of water changes under dry and very dry year conditions (**Table 4-5**). The volume of carryover storage is represented by the sum of water stored in reservoirs proposed to supply the Project as of October 1. Metered use and October 1 storage volumes are used here to represent how surface water availability changes in dry and very dry years.

In 2013, a Very Dry year according to the precipitation frequency analysis presented in Section 2.2, metered use from the project reservoirs was 879 acre-feet and the amount of water remaining in storage at the end of the water year was 3,380 acre-feet. The sum of these two volumes, 4,260 acre-feet, represents the total surface water availability under Very Dry year conditions (**Table 4-6**). Dry year surface water availability is represented by the average of the sum of metered use and end of year reservoir storage for water years 2013 to 2016. The Dry year surface water availability, indicated by data

collected during recent drought conditions, is 4,600 acre-feet (**Table 4-6**).[8] The Dry year and Very Dry year surface water availability considered here assumes that no water is available for diversion under the riparian rights, due to more limited timing and duration of flow during the growing season in Dry and Very Dry years.

Table 4-5: Project Area Water Use from Reservoirs and Carryover Storage

Water Year[1]	Middletown Precipitation[2] (inches)	Reservoir Depletions[3] (Acre-feet)	End of Water Year Reservoir Storage[4] (Acre-feet)	Metered Use from Reservoirs[5] (Acre-feet)	Sum of End of Water Year Storage and Metered Use (Acre-feet)
2011	49.59	3,275	4,249	1,156	**5,405**
2012	34.24	4,527	4,654	1,171	**5,825**
2013	22.64	3,699	3,380	879	**4,260**
2014	19.69	3,277	3,814	1,215	**5,030**
2015	30.93	3,828	2,998	1,463	**4,461**
2016	40.6	3,345	3,816	916	**4,732**
2017	84.53	3,346	4,784	1,061	**5,845**
2018	18.02[6]	6,043	5,764	861	**6,625**

[1] Water year is the period from October 1 to September 30, named for the calendar year on September 30.
[2] Middletown precipitation as reported at NOAA Station ID: USC00045598.
[3] Reservoir depletions reflect total changes in reservoir storage over the year and include evaporation and seepage losses and all uses.
[4] End of Water Year Reservoir Storage is the sum of water remaining in the reservoirs that would serve the proposed Project as measured on October 1, excepting 2011 when November 1 data were used because October 1 data are unavailable.
[5] Metered use reflects water applied to developed areas based on meter recordings.
[6] Water year 2018 precipitation data from NOAA Station ID: USC0004559 are incomplete, missing records from February and March.

[8] Although the precipitation record reflects an increase in precipitation received in water year 2016, the combined volume of metered use and end of year storage in 2016 was more comparable to the Dry years from 2013 to 2015 than 2012.

Records of surface use in recent years demonstrate the capacity of existing facilities to meet demands that occurred in those years but do necessarily reflect the total supply that could have been diverted and used to meet different demands. Wagner & Bonsignore (2019) estimated the amount of surface water available for use by existing and proposed uses, include the Project and other proposed vineyard expansions (see Section 5). Their analysis accounts for the total amount permitted to be withdrawn from storage in a given year and reductions due to annual evaporative losses from storage. Those results, when excluding the Big Basin Reservoir (Napa Valley Lake), indicate that permitted withdrawals from storage of about 8,600 AFY may be reduced by 1,770 AFY due to evaporative losses. The net amount of 6,800 AFY available to withdraw from storage would be augmented by direct diversion under riparian rights. Riparian right diversions have averaged 560 AFY between 1999 and 2018. Combing the net amount available for withdrawal from storage and the average annual riparian diversions results in an estimated total available supply of approximately (6,800 AFY + 560 AFY) 7,360 AFY. This amount reflects the anticipated availability of surface water under normal year conditions (**Table 4-6**).

Table 4-6: Current and Future Surface Water Supply Availability

Year Type	Normal Year	Dry Year	Very Dry Year
Current Availability (2020 – 2029)	7,360	4,600	4,200
Projected Future Availability (2030 – 2040)	7,360	5,600	5,200

Normal year availability is represented by the amount that the Project could generate under approved water rights, including appropriative and riparian, accounting for reservoir evaporation losses.

Dry and very dry year availability is represented by amounts of metered use during recent drought conditions (water years 2013 – 2016) and the amount of water remaining in storage at the end of those same water years.

Projected future availability is increased by 1,000 acre-feet in dry and very dry years consistent with the net increase in storage capacity at Upper Bohn Lake planned as a result of work planned to be completed in 2020.

4.3 Anticipated Recycled Water Availability

The Project proposes that new development clusters will be connected to new sanitary sewer systems and conveyed to new wastewater treatment facilities designed to produce recycled water suitable for reuse as landscaping irrigation and make up water for ornamental ponds and water features (Sherwood Design Engineers, 2019b). The estimates for recycled water availability show that 163 acre-feet of water would be available annually with the completion of Phase One of the Project (**Table 4-7**). The Future Phase of development is projected to include similar resort, resort accessory, and residential land uses, consistent with the proposed Guenoc Valley District zoning classification, that will generate additional wastewater for treatment by sanitary sewer systems. Based similarities in land uses between Phase One

and the Future Phase, it is assumed that the Future Phase of development will result in an additional recycled water supply increment of at least 163 acre-feet at full build-out.

Table 4-7: Current and Future Recycled Water Supply Availability

Year Type	Normal Year	Dry Year	Very Dry Year
Current Availability	0	0	0
Projected Future Availability: Phase One (2020 – 2029)	163	163	163
Projected Future Availability: Phase One and Future Phase (2030 – 2040)	326	326	326
Recycled water availability will vary based on system build-out, which will coincide with build-out of Project amenities that will generate wastewater flows for treatment. For the purposes of this WSA, it is assumed that the Project will achieve full build-out conditions of Phase One within the first five years and that Future Phase build-out will occur by 2030. The projected timing to build-out of the Future Phase used for this WSA is intended to provide a conservative estimate of future demands, within the required 20-year period of analysis.			

4.4 Summary of Existing Water Use

Existing potable and non-potable uses are summarized in **Table 4-8**. Amounts reflect average annual uses of surface water and groundwater in recent years, as described above. Reductions in surface water use in the period from 2014 to 2018 reflect the transition from irrigated pasture and golf course irrigation to irrigation of vineyards only.

Table 4-8: Existing Water Use Summary

Use Type	Average Annual Use by Year (Acre-feet)	
	2009 - 2013	2014- 2019
Potable Uses		
Project Area – Guest house/hunting lodge (occasional domestic use and landscape irrigation)	1	1
Adjacent Non-Project Areas – Langtry House (domestic uses and landscaping)	2	2
Adjacent Non-Project Areas - Langtry Estates Winery	6	6
Potable Water Use Subtotal	9	9
Non-Potable Uses		
Project Area: Tephra Ridge Vineyard Irrigation and frost protection outside Places of Use	42	42
Project Area: Irrigation, within Places of Use	1,400	1,060
Adjacent Non-Project Areas – Upper Bohn area vineyard outside Places of Use	-	63
Adjacent Non-Project Areas – Irrigation, within Places of Use	330	330
Non-Potable Water Use Subtotal	1,772	1,495
Total Existing Use	**1,781**	**1,504**

Domestic uses include landscaping demands.

Winery use is as reported by Randy Sternberg, Lotusland Investment Holdings VP, personal communication 10/3/2019.

Vineyard irrigation uses are 1 AF/acre consistent with reported deliveries of surface water metered in Project reservoirs.

Irrigation uses are as reported through 2018 by Wagner and Bonsignore Consulting Civil Engineers and include reservoir losses to evapotranspiration and seepage. Project Area irrigation within Places of Use included pasture and golf course irrigation prior to 2016.

5 PLANNED FUTURE WATER DEMANDS

This section summarizes the projected future demands for both phases of the Project and other changes to water demands anticipated to occur in the Project Area and Adjacent Non-Project Areas. Planned future water demands for the Project Area include both potable and non-potable components. Future Project demands are based on information developed for the Project. Additional non-potable demands expected to occur due to new vineyard acreage planned to be developed as part of existing leases and separate land use approvals.

5.1 Project Area Potable Water Demands

Projected potable water demands include new uses to be developed as part of the Maha Resort. The demands include resort facilities (temporary lodging), residential development (including workforce co-housing), resort amenities, agricultural production facilities, and essential accessory uses (Sherwood Design Engineers, 2019a). Total new average annual potable water demands anticipated for Phase One are 249 acre-feet per year (AFY), of which 18 AFY would occur in Middletown within the service area of the Collayomi County Water District (**Table 5-1**). Allowable uses within future phases result in additional potential demands of 436 acre-feet per year at full build-out, of which 12 AFY would occur in Middletown within the service area of the Collayomi County Water District (**Table 5-2**).

Table 5-1: Maha Resort Phase One Average Annual Potable Water Demand

Use	Unit	Quantity	Water Demand (gallons)	Average Occupancy Rate (percent)	Average Annual Water Demand (GPY)	Average Annual Water Demand (AFY)

5.2 Project Area Non-Potable Water Demands

Projected non-potable water demands include new uses to be developed as part of the Maha Resort and new uses associated with additional vineyard lands not yet planted. Non-potable demands associated with the Maha Resort are planned to occur in two phases, consistent with the potable water demands(**Table 5-4** and **Table 5-5**). Resort-related non-potable demands include "landscape irrigation demands for the commercial and residential properties, new vineyard and farm areas, recreational areas including the Renaissance Golf Course and the Equestrian Center, roadway landscaping and greenroofs" (Sherwood Design Engineers, 2019a).Non-potable water demands will also include "make up water for non-recreational water features (fountains and reflection pools)" (Sherwood Design Engineers, 2019a). Non-potable water is planned to be supplied by three sources: recycled water, existing entitled surface water rights and groundwater. As described in Section 2, approved Places of Use are part of the surface water rights and limit the areas where surface water may be used. Tables in this section report the planned demands for water within and outside Places of Use in order to help understand what source or sources of supply may be used to meet the planned demands.

Table 5-4: Maha Resort Phase One Annual Non-Potable Water Demand Estimates

Total Estimated Future Phase Non-Potable Water Demand (AFY)						**1187.3**	**759.2**

Source: Sherwood Design Engineers, 2019a

In addition to the planned landscaping and other non-potable water uses associated with the Maha Resort, the Project Area includes approximately 1,132 acres of land previously leased for vineyard installation (**Table 5-6**). The additional leased acreage, not currently planted, includes approximately 1,115 acres within Places of Use, which will rely on existing surface water right entitlements, and approximately 18 acres outside of Places of Use, to be supplied by groundwater. Sources of supply for these planned demands include existing entitled surface water and groundwater.

Table 5-6: Previously Approved Project Area Vineyard Lease Water Demand Estimates

	Within Places of Use		Outside Places of Use			
	Acres	Annual Water Use Estimate (AFY)	Acres	Annual Water Use Estimate (AFY)	Total Acres	Total Avg. Annual Non-Potable Demand (AF)
Amended Lease Lands (Future Project Area Vineyards not part of Project)	1,115	1,1115	18	18	1,132	1,132

5.3 Adjacent Non-Project Area Water Demands

Adjacent Non-Project Areas (ANPA) include approximately 505 acres near Bucksnort Creek in Guenoc Valley and approximately 720 acres in Napa County. Existing water demands are planned to continue in both areas, with additional vineyard expansion likely in the Napa County portion of the ANPA. As described in Section 2.4, the Napa County ANPA includes approximately 330 acres currently planted with vineyards. Napa County has previously approved an approximately 390 acres of additional vineyard plantings in the areas (**Table 5-7**). While not a part of the Project, for the purposes of this WSA, it is assumed that all 390 acres will be established, consistent with Napa County approvals. Sources of supply for these planned demands include existing entitled surface water and groundwater.

Table 5-7: Previously Approved Adjacent Non-Project Area Vineyard Water Demand Estimates

	Within Places of Use (POU)		Outside POU			
	Acres	Annual Water Use Estimate (AFY)	Acres	Annual Water Use Estimate (AFY)	Total Acres	Total Avg. Annual Non-Potable Demand (AF)
Previously Approved Additional Vineyards in Napa County (not part of Project)	390	390	0	0	390	390

5.4 Summary of Planned Future Water Demands

Planned future potable water demands are summarized in **Table 5-8** and represent uses planned to occur in addition to existing potable uses described in Section 4. Future potable water demands are anticipated to occur as a result the Project during both Phase One and through Future Phase developments. As noted in Section 5.1, Workforce co-housing demands of 18 AFY in Phase One and 12 AFY in the Future Phase would occur in Middletown within the service area of the Collayomi County Water District and are not considered a demand to be met by Project Area sources of supply.

Table 5-8: Planned Future Potable Water Demand Summary

Planned Future Use	Project Area (AFY)	Colloyami County Water District (AFY)	Average Annual Demand (AFY)
Potable Demands			
Maha Resort Phase One[1]	231	18	249
Maha Resort Future Phase[1]	424	12	436
Planned Potable Demand Total	**655**	**30**	**685**

[1] Potable Demands for the Maha Resort Project, Phase One and Future Phase include 18 AFY and 12 AFY, respectively (see Section 5.1). Those demands are planned to occur in Middletown within the service area of the Collayomi County Water District. They area reported separately here and are not considered a demand to be met by Project Area sources of supply.

Planned future non-potable water demands are summarized in **Table 5-9** and represent uses planned to occur in addition to existing non-potable uses described in Section 4. Future non-potable water demands are anticipated to occur as a result the Project during both Phase One and through Future Phase developments.

Table 5-9: Planned Future Non-Potable Water Demand Summary

Planned Future Use	Non-Potable Demands In Places of Use (AFY)	Non-Potable Demands Outside Places of Use (AFY)	Average Annual Demand (AFY)
Non-Potable Demands			
Maha Resort Phase One	545	482	1,027
Maha Resort Future Phase	1,187	759	1,946
Project Area Vineyard Lease	1,115	18	1,133
Adjacent Non-Project Area Vineyard	390	-	390
Planned Non-Potable Demand Subtotal	**3,237**	**1,259**	**4,496**

6 WATER SUPPLY SUFFICIENCY

SB 610 requires that a WSA report findings regarding water supply sufficiency to meet projected water demands, including existing demands planned to continue, under the normal, single-dry, and multiple-dry year planning scenarios. Sufficiency is addressed in this section by comparing the projected water demands presented in Section 5 with the available supply and current water uses presented in Section 4. For the purposes of this analysis, it is assumed that the Project will achieve full build-out conditions of Phase One within the first five years and that Future Phase build-out will occur by 2030. The projected timing to build-out of the Future Phase used for this WSA is intended to provide a conservative estimate of future demands, within the required 20-year period of analysis.

6.1 Summary of Water Supply Availability to 2040 (Normal, Dry, and Multiple-Dry Years)

The Project Area includes existing supplies of surface water and groundwater and a planned future supply of recycled water to meet potable and non-potable demands, both existing and proposed. Current and future water rights, entitlements, and contracts, are summarized in **Table 6-1**, as presented in Section 4. Supply types are designated here for consistency with Water Code Section 10910. As described in Section 2.4.3 and Section 4.3 the recycled water supply for the project is planned to be developed as part of the Project itself and used to meet Project demands.

Table 6-1: Sources of Supply

Source	Annual Amount (acre-feet)	Type[1]	Used Previously
Local Surface Water[2]	10,394.5	Entitlement	Yes
Groundwater[3]	8,700 – 4,950	Right	Yes
Recycled Water[4]	163- 326	Contract	No

[1] Supply types are designated here for consistency with Water Code Section 10910, the planned future recycled water supply is referenced here a "contract" though the supplier would be the Project's own planned water system.
[2] See Section 2.4.2, permitted total appropriative surface water authorized diversion to storage (excluding Big Basin Reservoir outside of the Project Area, plus 560 acre-feet of estimated riparian water use, 1999 – 2018.
[3] See Section 4.1.5
[4] See Section 4.3

Projected availability of groundwater in future years, through 2040, reflects the range of groundwater availability determined through the analysis of current and projected future hydrologic conditions processes, including hydrologic impacts due to climate change (see Section 4.3.3) (**Tables 6-2 and 6-3**). Specifically, the availability of groundwater projected for years from 2020 through 2040 account for the volume of groundwater recharge not subject to discharge through natural processes (including evapotranspiration, contributions to streamflow, and subsurface groundwater flow).

Projected surface water availability in future years, through 2040, reflects the range of surface water availability determined through review of the variability of diversions and use of surface water occurring in the Project Area since 2011 and the permitted capacity for the project to divert and use surface water with consideration for reservoir evaporation losses and the limited availability of riparian right diversion in Dry and Very Dry years (see Section 4.2). The projected surface water availability also reflects the net increase of 1,000 acre-feet available from Upper Bohn Reservoir as a result of dam reconstruction and diversion upgrades previously approved by the 2006 Water Right Modification and scheduled for completion in 2020.

Recycled water is shown as a source of supply beginning in 2020 to coincide with the initiation of Project Phase One demands, also shown to begin in 2020 for the purpose of this sufficiency assessment. The actual timing of both recycled water supply availability and Project Phase One demands will likely be somewhat different and subject to the progress of Project construction.

The amounts represented as single dry year supplies in **Table 6-2** and **Table 6-3** correspond to the supplies described under Very Dry year conditions presented in Sections 4.1.5 (groundwater), 4.2 (surface water), and 4.3 (recycled water).

Projected recycled water availability in future years, through 2040, is consistent with projections of project build-out, including build-out of recycled water facilities (Sherwood Design Engineers, 2019b).

Table 6-2: Water Supply Availability for 2020 (Normal, Dry, and Multiple-Dry Years)

Source of Supply	Annual Water Supply (acre-feet)				
	Normal Year	Single Dry Year[1]	Multiple Dry Years[2]		
			2	3	4
Groundwater	8,700	4,800	6,570	6,570	6,570
Local Surface Water	7,360	4,200	4,600	4,600	4,600
Recycled Water	**163**	**163**	**163**	**163**	**163**
Total Supply	**16,223**	**9,163**	**11,333**	**11,333**	**11,333**

[1] Single dry year supplies correspond to the Very Dry year supply availability described in Section 4.
[2] Multiple dry year supplies correspond to the multiple Dry year supply availability described in Section 4.

Table 6-3: Projected Water Supply Availability for 2040(Normal, Dry, and Multiple-Dry Years)

Source of Supply	Annual Water Supply (acre-feet)				
	Normal Year	Single Dry Year[1]	Multiple Dry Years[2]		
			2	3	4
Groundwater	6,200	3,740	4,950	4,950	4,950
Local Surface Water	7,360	5,200	5,600	5,600	5,600
Recycled Water	**326**	**326**	**326**	**326**	**326**
Total Supply	**13,886**	**9,266**	**10,876**	**10,876**	**10,876**

[1] Single dry year supplies correspond to the Very Dry year supply availability described in Section 4.
[2] Multiple dry year supplies correspond to the multiple Dry year supply availability described in Section 4.

6.2 Summary of Water Supply Sufficiency to 2040 (Normal, Dry, and Multiple-Dry Years)

For the purposes of this analysis, it is assumed that the Project will achieve full build-out conditions of Phase One within the first five years and that Future Phase build-out will occur by 2030 (**Table 6-4** and **Table 6-5**). The projected timing to build-out of the Future Phase used for this WSA is intended to provide a conservative estimate of future demands, within the required 20-year period of analysis. Demands associated with all planned future uses of water in the Project Area are reported here as average annual demands, which reflect a level of demand expected to occur over a period of years. Demands may fluctuate from year to year according to resort occupancy and staffing levels or due to water year type and meteorological conditions but are expected to remain consistent with the average annual demand projections over periods of five years or more.

Table 6-4: Normal Water Year Potable Water Supplies and Demands Through 2040

	2020	2025	2030	2035	2040
Potable Supply[1]					
Groundwater[1]	800	800	800	800	800
Total Supply	**800**	**800**	**800**	**800**	**800**
Potable Demand[2]					
Existing Uses	9	9	9	9	9
Maha Resort Phase One	249	249	249	249	249
Maha Resort Future Phase	0	0	436	436	436
Total Demand	**258**	**258**	**694**	**694**	**694**
Potable Surplus or Deficiency	**542**	**542**	**106**	**106**	**106**

[1] Groundwater will be supplied by wells in the Project Area (see Section 2.4.1).
[2] Existing uses are described in Section 4. Proposed future demands are described in Section 5.

Table 6-5: Normal Water Year Non-Potable Water Supplies and Demands Through 2040

	2020	2025	2030	2035	2040
Non-Potable Supply[1]					
Local Surface Water	7,360	7,360	7,360	7,360	7,360
Groundwater	7,900	7,900	5,400	5,400	5,400
Recycled Water	163	163	326	326	326
Total Supply	**15,423**	**15,423**	**13,086**	**13,086**	**13,086**
Non-Potable Demand in Places of Use (POU)[2]					
Existing Uses	1,390	1,390	1,390	1,390	1,390
Expanded Vineyard Lease	1,115	1,115	1,115	1,115	1,115
Adjacent Non-Project Area Vineyard	390	390	390	390	390
Maha Resort Phase One	545	545	545	545	545
Maha Resort Future Phase	0	0	1,187	1,187	1,187
Total Demand	**3,440**	**3,440**	**4,627**	**4,627**	**4,627**
Non-Potable Surplus or Deficiency in POU	**3,920**	**3,920**	**2,733**	**2,733**	**2,733**
Non-Potable Demand outside POU					
Existing Uses	105	105	105	105	105
Expanded Vineyard Lease	9	18	18	18	18
Maha Resort Phase One	482	482	482	482	482
Maha Resort Future Phase	0	0	759	759	759
Total Demand	**596**	**605**	**1,364**	**1,364**	**1,364**
Non-Potable Surplus or Deficiency outside POU	**7,467**	**7,458**	**4,362**	**4,362**	**4,362**

[1] Groundwater demands generated by the Project will be supplied by wells in the Project Area (see Section 2.4.1). The groundwater supply shown for non-potable uses is equal to the total available supply described in Section 4.1.5 less the supply shown for potable uses in Table 6-4.
[2] Existing uses are described in Section 4. Proposed future demands are described in Section 5.

Water supply sufficiency is considered for normal, single dry, and multiple dry year types in 2020 (**Table 6-6)** and 2040 (**Table 6-7**) to reflect the anticipated changes in demand anticipated to occur over time. Surface water supplies are projected to remain stable during sequential dry years based on the ability of Project reservoirs to receive diverted water in dry years (see Section 4.2). Groundwater supplies are projected to remain stable during sequential dry years based on the analysis of groundwater recharge showing that groundwater recharge continues to occur in dry year. Recycled water supplies are projected to remain stable in sequential dry years because the supply is linked to the generation of wastewater by the Project's potable water system, which will continue in dry years.

The availability of water supplies is projected to exceed projected water demands, including both Phase One and the Future Phase of development as well as other planned future demands and continuation of existing demands. The supply sufficiency is projected to result in surpluses through 2040 without causing overdraft of groundwater supplies and without exceeding the surface water supplies available to the Project (**Table 6-6** and **Table 6-7**).

Table 6-6: Comparison of Water Supply Sufficiency for 2020 (Normal, Dry, and Multiple-Dry Years)

	Annual Water Supply and Demand (acre-feet)				
	Normal Year	Single Dry Year	Multiple Dry Years		
			2	3	4
Potable Supply Total[1]	800	800	800	800	800
Potable Demand Total[2]	258	258	258	258	258
Potable Surplus or Deficiency	**542**	**542**	**542**	**542**	**542**
Non-Potable Supply in Places of Use (POU)[1]	7,360	4,200	4,600	4,600	4,600
Non-Potable Demand Total, in POU[2]	3,440	3,440	3,440	3,440	3,440
Non-Potable Surplus or Deficiency in POU	**3,920**	**760**	**1,160**	**1,160**	**1,160**
Non-Potable Supply outside POU[1]	7,900	4,000	5,770	5,770	5,770
Non-Potable Demand Total outside POU[2]	596	596	596	596	596
Non-Potable Surplus or Deficiency outside POU	**7,304**	**3,404**	**5,174**	**5,174**	**5,174**

[1] Reflects groundwater, surface water, and recycled water supplies, as applicable, and water year supply variability (see Sections 4.1.5, 4.2, 4.3).
[2] Includes existing demands planned to continue and all planned future demands, expecting the Future Phase Maha Resort development assumed to reach build-out by 2030 (see Section 4.4 and Section 5).
[3] Places of Use (POU).

Table 6-7: Comparison of Projected Water Supply Sufficiency for 2040 (Normal, Dry, and Multiple-Dry Years)

	Annual Water Supply and Demand (acre-feet)				
	Normal Year	Single Dry Year	Multiple Dry Years		
			2	3	4
Potable Supply Total[1]	800	800	800	800	800
Potable Demand Total[2]	694	694	694	694	694
Potable Surplus or Deficiency	**106**	**106**	**106**	**106**	**106**
Non-Potable Supply in Places of Use (POU)[1]	7,360	5,200	5,600	5,600	5,600
Non-Potable Demand Total, in POU[2]	4,627	4,627	4,627	4,627	4,627
Non-Potable Surplus or Deficiency - POU	**2,733**	**573**	**973**	**973**	**973**
Non-Potable Supply outside POU[1]	6,526	4,066	5,276	5,276	5,276
Non-Potable Demand Total outside POU[2]	1,364	1,364	1,364	1,364	1,364
Non-Potable Surplus or Deficiency - outside POU	**5,162**	**2,702**	**3,912**	**3,912**	**3,912**

[1] Includes projected supplies of groundwater, surface water, and recycled water, as applicable (see Sections 4.1.5, 4.2, and 4.3).
[2] Includes existing demands planned to continue, all planned future demands (Section 4.4 and Section 5).

7 RECOMMENDATIONS

7.1 Groundwater Monitoring Program

While the information presented in this WSA reflect considerable groundwater resources available to the Project, it is recommended that the Project implement a groundwater monitoring program to routinely collect groundwater level and quality data in the vicinity of Project water supply wells and wells supplying Adjacent Non-Project Areas. The monitoring program should be developed consistent with the Lake County Groundwater Management Plan (CDM, 2006). Objectives of the monitoring program should include ensuring that groundwater supplies remain sustainable for the Project and Adjacent Non-Project Areas.

7.2 Continued Groundwater Exploration to Verify New Well Capacity

It is recommended that new supply wells for planned Project water system continue to be constructed and tested in order to demonstrate, consistent with State and County codes and regulations, that hydrogeologic conditions will support the planned production rates from Project wells. This recommendation is consistent with the activities already underway to permit, construct, and test new production wells including Camping Area Production Well 1 and Farmstead Production Well 1, constructed and tested in 2019. Although the Project production wells constructed and tested have, as of this report, shown a capacity for sustained production at rates consistent with levels likely to be needed for water system operations, it is recommended that the Project move forward with future well construction and testing to fully demonstrate the capacity to produce groundwater at rates that will be required for Phase One water system operations.

Napa Valley Lake [8]	44	

(1) Reservoir depletion per developed acre based on reservoir elevation measurements and includes evaporation, seepage and all uses.
(2) Applied water per developed acre based on meter recordings and does not include evapoaration and seepage.
(3) 302 acres vineyard, 596 acres pasture, 88 acre golf course.
(4) All pasture
(5) 122 acre vineyard, 192 acre pasture.
(6) No meters installed.
(7) No meters installed.
(8) Estimate based on ((2145 min. x 55gpm x 122 acres)/325,851 gal/af).

Guenoc Valley [3]	0	38	48
Upper Bohn [4] [6]	0	5	7
Napa Valley Lake [5]	0	20	40

(1) Reservoir depletion per developed acre based on reservoir elevation measurements and includes evaporation, seepage and all uses.
(2) Applied water per developed acre based on meter recordings and does not include evaporation and seepage.
(3) 663 Acres of Vineyard, 222 acres of Pasture, 90 Acres of Golf Course. Golf course irrigation ended 9/2015, pastures converted to vineyard in 2016
(4) 246 Acres of Vineyard, 281 Acres of Pasture. Pastures converted to vineyard in 2016
(5) All Vineyard
(6) Meter data incomplete, Some outlet and irrigation meters were installed in 2014 and 2015

(1) Reservoir depletions based on reservoir elevation measurements includes evaporation, seepage and all uses.
(2) Detert Reservoir was drained in 2018 to facilitate outlet repairs.
(3) Water applied to developed areas based on meter recordings and does not include evaporation and seepage.
(4) Water lost to evaporation or seepage based on reservoir elevation measurements. Negative values are the results of inflows coinciding with metered use or transfer of water to satellite reservoirs.
(5) Water released from Guenoc Valley and picked up at Pump #2 for irrigation is measured at Napa Valley Lake Metered
(6) Includes water transferred from Guenoc Valley to Upper Bohn. Includes groundwater pumped into Upper Bohn.

(1) Reservoir depletions based on reservoir elevation measurements includes evaporation, seepage and all uses.
(2) Water applied to developed areas based on meter recordings and does not include evaporation and seepage.
(3) Water lost to evaporation or seepage based on reservoir elevation measurements. Negative values are the results of inflows coinciding with metered use or transfer of water to satellite reservoirs.
(4) Meter data incomplete, Some meters were installed August 2015. Includes groundwater pumped into Upper Bohn.
(5) Water released from Guenoc Valley and picked up at Pump #2 for irrigation is measured at Napa Valley Lake Metered Applied Water.

Transmittal: **Wastewater Feasibility Study for Maha Resort at Guenoc Valley**

Dear Chris and Kirsty:

Sherwood Design Engineers, Inc. (SDE) is pleased to present the revised Administrative Confidential Internal Draft Wastewater Feasibility Study ("Study") for Maha Resort at Guenoc Valley.

The primary purpose of this Study is to evaluate the available technical information to ascertain if there is a means to collect, treat, and dispose or reuse the wastewater generated for both the first and future phases of the Maha Resort at Guenoc Valley ("Project"). The study provides a compilation and review of critical information and data that will be needed to demonstrate the viability of the project to both local and state water regulators and to secure water related permits for the project.

The result of our analysis of the currently available data and information indicate that the proposed project is viable to manage and reuse treated wastewater at the site. The wastewater management plans will be permitted by the California Regional Water Quality Control Board and can be permitted within the State's permitting framework without any special requirements. The project is also consistent with the State's water recycling policies and regulations.

Thank you for the opportunity to assist you with this intriguing and complex project. Please contact me if you have any questions or require any additional information.

Sincerely,

Peter Haase

1. Introduction

The Maha Resort at Guenoc Valley has applied to the County of Lake for a development application. Pursuant to the California Environmental Quality Act (CEQA) the application will include an Environmental Impact Report (EIR). The EIR will include a programmatic analysis of the impacts to rezone the 16,000-acre Guenoc Ranch to "Guenoc Valley District (GVD)". In addition to the programmatic level EIR to allow the rezone, the EIR will include a detailed, project level analysis of the impacts at a Project level review of the first phase (Phase I) of development, submitted as the Specific Plan of Development (SPOD).

The Programmatic review of the overall project will occur in the EIR to assess the environmental impacts of the entire project proposal. Project level review will analyze the specific objectives and environmental impacts of the proposed first phase of development, as outlined in the SPOD. The Project Level review EIR will analyze the environmental changes caused by a development including the construction and operation, whereas the programmatic EIR will look at the impacts of the rezone classification rather than a project specific analysis. Future phases of the project will require additional CEQA review.

The SPOD identified Phase I as the construction of the roads and the utility infrastructure, approximately 255 hotel rooms, 144 resort residential units, and 411 Residential villas ("Total Units")[1], workforce and staff housing, and the accessory to resort commercial structures. This report looks at the wastewater feasibility of these operations relating to the phase one development. Future phases or future development will include additional hotel rooms, resort residential units, residential villas, new roads and utility infrastructure; however, the exact number and location of the anticipated improvements are unknown at this time.

This report presents the wastewater feasibility study in detail for the first phase and in concept for the future phases. The primary purpose of this study is to evaluate both phases of the Project on wastewater generation and the methods for collection, treatment, and disposal or reuse of the wastewater. The study evaluates the potential impacts the wastewater systems could have on adjacent properties and to sensitive cultural, historical and biotic resources on the property. The study provides a compilation and review of critical information and data that will be needed to demonstrate the viability of the project to both local and state water regulators and to secure water related permits for the project.[2]

[1] Since the publication of this study, the total units have been updated to be less than the number indicated here based on the tentative map lot analysis; therefore, the total analysis is conservative.
[2] General Plan of Development submitted December 2018. SPOD & Tentative Maps submitted May 2019.

2. Site and Project Description

The Maha Resort at Guenoc Valley (Project) is situated on a 16,000 acre property within the Guenoc Valley in Lake County, California. The project is located approximately three miles southeast of Middletown on the southeast border of Lake County, bordering Yolo and Napa Counties to the south and east. Figure 1 presents a site vicinity map. The Project site is approximately 95 miles northeast from San Francisco, 85 miles southwest from Sacramento, 40 miles east of Santa Rosa and 25 miles southeast from Clearlake.

The Guenoc Valley is a small inland valley set on an alluvial fan, isolated from surrounding areas by rocky ridges and volcanic outcroppings and rock. As part of the inner coastal range of Northern California, the site is characterized by varied topography, with rolling hills, oak woodlands, irrigated vineyards, grazing corridors, open spaced, meadows and lakes. Ground elevation ranges from 600 to over 1,600 feet above sea level. The average rainfall is 35 inches a year.

The Project proposal presented to Lake County is to transform the property into a state-of-the-art hospitality, rural residential and recreational facilities set into the rural landscape. The Project is organized into individual resort communities, defined by low impact designs that prioritize low density and clustered development, preserving surrounding open space and agricultural cultivation. The resort communities have been designed to be built with and into the landscape to minimize construction impacts to the natural landscape and habitats.

The Project preserves the long history of agricultural use by maintaining the vineyards and grazing lands while enhancing and diversifying agricultural production to include gardens, culinary education, farmers markets, agricultural retail sales, and resale opportunities for local artisans and business.

The Project commercial elements will include small boutique hotels, commercial shops, and small artisanal food and winery production facilities, small farm and integrative animal husbandry elements and spa and restaurants. The key recreational facilities will include an equestrian center, an 18-hole golf course, rural recreation and camping facilities.

Each resort community or cluster will include a mixture of hotel units, resort residential and residential villas. The clustering of development reduces the sprawl of the development and results in the consolidated hubs for critical utilities, while preserving the rural landscape and agricultural qualities of the property. The Project plans result in a very low-density development, an average of 0.1 unit per acre, with the average lot size of 5 acres for the residential villas with portions of each lot held in conservation.

The Project will also include essential operational facilities including workforce housing, central back-of-the-house operations, and emergency response center.

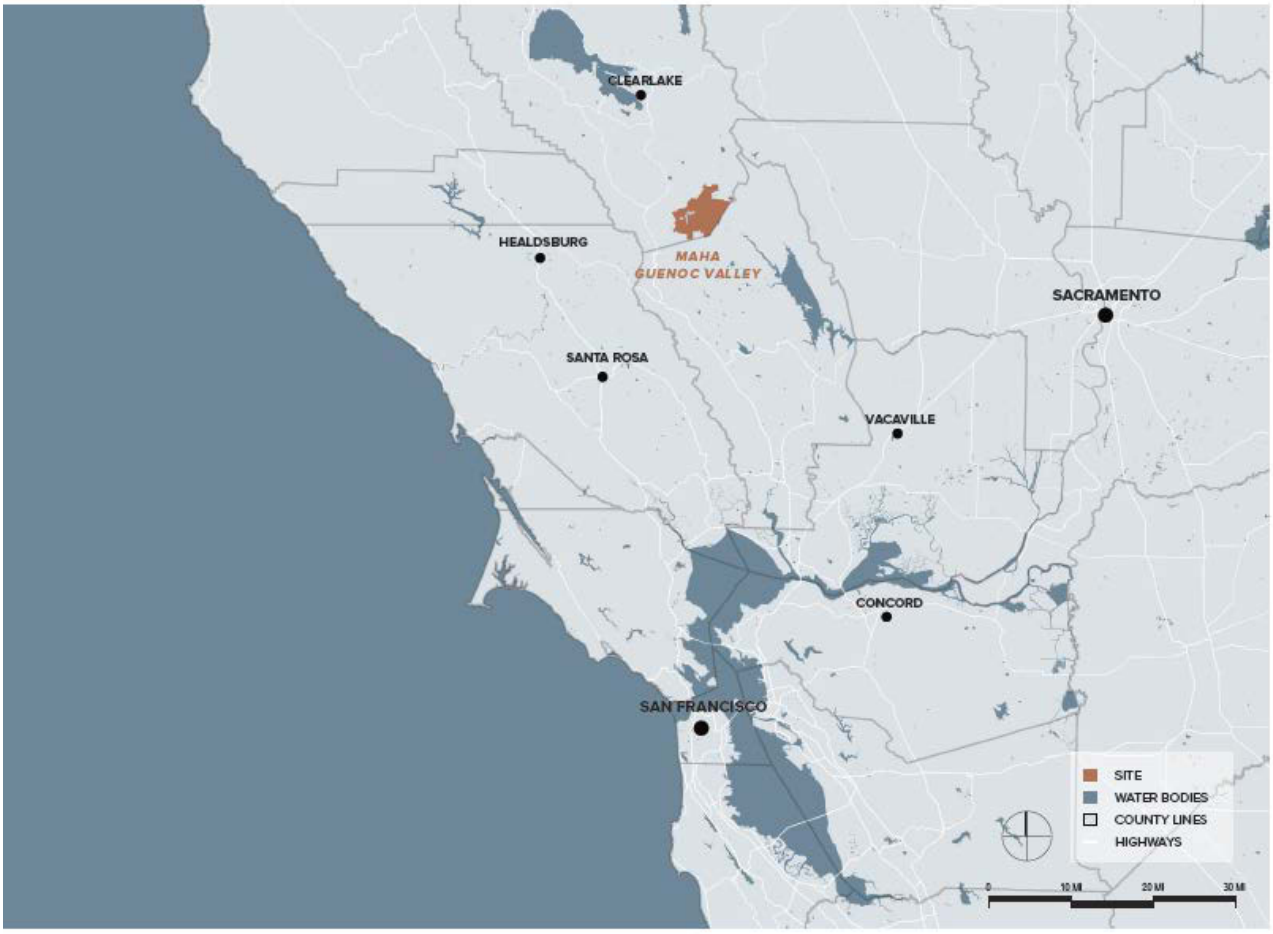

Figure 1. Site Vicinity Map

3. Land Use and Physical Setting

3.1. Existing Land Use

The Guenoc Valley is a small inland valley comprised of varying landscape and vegetation characteristics. The natural landscape includes grasslands, chaparral and oak woodlands. The property also includes vineyards, grazing lands and rural residential developments. A unique and rich feature of the property are the various lakes and creeks and associated wetlands and riparian habitat.

Historically, Guenoc Valley has been grazed by cattle and sheep for centuries. In 1925 William F. Detert constructed Deterted Reservoir and the valley floor irrigation project, which is still in use today. After irrigation was introduced into the Guenoc Valley it became possible to grow vegetables, vineyards and forage crops to support the existing grazing operations. The Guenoc Ranch has been farmed for more than a century. At present there is still a significant cattle and sheep operation in conjunction with the vineyards.

Vineyards. The property includes some of the oldest vineyards planted in Lake County, which were part planted by the famous actress Lili Langtry. Since this early period of time the vineyards have slowly expanded. Beginning in the later 1970's expansion of the vineyard began and in 1980 construction started on the Guenoc Winery, which is still in production today. Most of the valley floor is now vineyard and vineyards are being planted throughout the property, irrigated from numerous lakes on the site. There are approximately 909 acres of vineyards currently planted most of which are managed by an existing leasor.

Grazing. Animal husbandry will continue to be an important economic, management and aesthetic experience of the Project. Cattle will continue to be rotated throughout the site within larger open and pasture areas. Sheep and goats will be used close to development areas to aid in reducing vegetation cover and fire risk.

Ranch Center. The main ranch center includes the ranch manager's home and several other homes, as well as barns and shed which are proposed to be relocated as part of this project. An older ranch home, known as the Gebhard Lodge, located to the northeast of the ranch center is used as a guesthouse and hunting lodge as it has been used for the past 100 year.

3.2. Surface Features

The property extends over many square miles and extends over both moderately steep rolling hills and the nearly level valley floor. Rubbly outcrops and boulders are common throughout the property. In general, the ground surface is soft and spongy. This is a condition generally associated with weak, porous surface soil. In some places, the surface soil is disturbed by randomly arrayed shrinkage cracks generally associated with expansive soil. Locally, expansive soil shrinks and swells with the weather cycle. The cyclic shrinking and swelling tends to disturb the upper portion of the expansive clay. This zone is defined hereinafter as the active layer. Natural drainage consists of sheet flow over the ground surface and slopes that concentrates in manmade surface drainage elements such as roadside ditches, and natural drainage elements such as swales, ravines, and creeks. There are several springs throughout the property.

3.3. Topography

The valley floors within the Guenoc area are fairly level, while the surrounding ridge and hill slopes are moderately steep. Elevation with the project site ranges from approximately 600 feet to 1,600 feet above mean sea level (msl). The Guenoc Valley region in the western portion of the property consists of relatively flat irrigated lands comprised of alluvial deposits within the 1) Bucksnort Creek drainage basin, with hills along the perimeter with approximate elevations ranging from 1,000 to 1,200 feet above msl in this area. 2) The Tephra Ridge region, located in the hills upstream from Cassidy Reservoir in the southwestern portion of the property, contains existing vineyard with elevations up to 1,200 feet above msl. 3) The Lower Bohn Valley region located in the central portion of the property includes irrigated and irrigable lands on the valley floor and gentle hillsides, with moderately steep slope ridges encircling the valley with elevations ranging from 800 to 1,200 feet above msl. Irrigated and irrigable land in the 4) Big Basin region includes alluvial deposits adjacent to Putah Creek and the lower reaches of Bucksnort Creek with elevations ranging from 600 to 800 feet above msl, and the area is surrounded by moderately steep slopes. 5) The Northern Ranch region includes more rugged land, with high plateau and mountainous areas with elevations ranging from 800 to 1,200 feet.

3.4. Soils

The soils over the project site are variable and typically range from very thin less than 2 feet thick to 10 feet in thickness above bedrock. Soil types in the Maha Resort Property include over 30 different soil series including, but not limited to: Benridge Variant loam, Bressa-Millsholm loam, Cole clay loam, drained; Forward Variant-Kidd; Henneke-Montara-Rock outcrop complex; Jafa complex; Konocti-Hambright complex, and Konocti complex.

3.5. Geology

Lake County is located within the California Coast Range geomorphic province. This province is a geologically complex and seismically active region characterized by sub-parallel northwest-trending faults, mountain ranges and valleys. The oldest bedrock units are the Jurassic-Cretaceous Franciscan Complex and Great Valley sequence sediments originally deposited in a marine environment. Subsequently, younger rocks such as the Tertiary-age Sonoma Volcanics group, the Plio-Pleistocene-age Clear Lake Volcanics and sedimentary rocks such as the Guinda, Domengine, Petaluma, Wilson Grove, Cache, Huichica and Glen Ellen formations were deposited throughout the province. Extensive folding and thrust faulting during late Cretaceous through early Tertiary geologic time created complex geologic conditions that underlie the highly varied topography of today. In valleys, the bedrock is covered by thick alluvial soil. The project area is in Lake county and borders Napa county.

The property is underlain by Quaternary terrace deposits and olivine basalt, as well as older units such as Cretaceous-Jurassic Franciscan sandstone, shale, mélange, serpentinite, and greenstone. There are also localized outcrops of Cretaceous-Jurassic Great Valley Sequence and Jurassic Knoxville Formation.

A substantial thickness of sand and gravel alluvial deposits occurs along Putah Creek on the northeast side of the property. Similar deposits to a thickness of 5-15 feet occur along Bucksnort Creek and in other large drainages. Thinner alluvium, mixed with silt and clay is common along smaller drainages.

3.6. Existing Wastewater Infrastructure

Lake County has three utility areas focused mainly in providing water and wastewater services in more densely populated areas. To service these areas, the County has 5 regional wastewater facilities. The nearest wastewater facility to the Project has the capacity to serve almost 500 residential connections in the Middletown and the Harbin Hot Springs areas. The wastewater system is located in Utility Area 3 and consists of over 10 miles of gravity collection system, 3 lift stations, and over 3 miles of force main to the Middletown Wastewater Treatment Plant. The treatment facility was constructed in the 1990s and currently operating near capacity. The facility has a facultative pond with a dry/wet flow of 0.128/0.24 MGD.[3] Middletown is located 5 miles west from the Project property boundary.

Lake County also has a wastewater recycling system. The treated effluent is used for geothermal power production (injection/re-use). There is 50 miles of effluent pipeline with an average flow rate of 5,800 gpm recycling about 85% of the wastewater collected from the County wastewater systems. The recycling program uses solar powered treatment and pumping and creates geothermal power through injection wells just south of Cobb Mountain.

The developed areas within the Project area have existing onsite wastewater system that consists primarily of septic tanks with leachfield disposal. These wastewater systems would remain in place unless development is proposed in the vicinity or is necessary in which case they will be modified as part of this proposal.

4. Water Regulations and Agency Approvals

4.1. Overview of Local and State Regulations Related to Wastewater

This section provides a brief summary of the relevant regulations pertaining to wastewater management and reuse for the project. Additional information will be addressed in the Tentative Map, the development agreement and the SPOD.

4.2. Lake County Code, Chapter 9 – Health and Sanitation

The Lake County Code that pertains to wastewater is Chapter 9 – Health and Sanitation, Article 3 – Sanitary Disposal of Sewage.

Chapter 9. Article 3 – Sanitary Disposal of Sewage. These requirements specify that any construction, addition to, alteration of, or modification of a wastewater system for the disposal, treatment or discharge of sewage requires securing a sanitation permit from the County Health Officer. Costs incurred by the County shall be borne by the sub-divider and shall be paid to the Director of Public Works prior to final approval of any improvement work, and inspection fees deposits as determined by the Public Works Department and adopted by the Board of Supervisors.

Under this Article the sub-divider must obtain approval of a new wastewater system from the County health officer demonstrating that the new wastewater system will comply with the local permitting requirements.

4.3. Lake County Code, Chapter 17 – Subdivision Regulations

The Lake County Codes that pertain to sanitary sewer includes several sections of Chapter 17 – Subdivision Regulations and Article 5 – General Design.

Chapter 17. Article 5 – General Design and Improvement Standards. These requirements specify that all sanitary sewer improvement shall conform to the County's "Standard Improvement Specifications". These requirements also state that all sanitary sewer facilities shall not be installed until all plans for such work have been submitted to, approved and signed by the Director of Public Works and by local and state agency. All sanitary sewer improvements shall be installed under the inspection of the, and to the approval of, the Director of Public Works or his duly authorized representative. Costs incurred by the County shall be borne by the sub-divider and shall be paid to the Director of Public Works prior to final approval of any improvement work, and inspection fees deposits as determined by the Public Works Department and adopted by the Board of Supervisors.

Under this Article the sub-divider must obtain approval of a new sanitary sewer system from the County health officer demonstrating that the new wastewater system will comply with the local permitting requirements. When a new wastewater system is proposed the sub-divider shall demonstrate that the proposed design has been approved by the County Health Office and the Director of Public Works.

When connection to an existing sanitary sewer system is not feasible, the sub-divider shall provide evidence to the County Health Officer certifying that the site has ground slopes and soil conditions for satisfactory disposal by septic tanks or other approved method.

The Article further states that the SWRCB requirements for proposed waste discharge shall be complied with pursuant to Section 13260 of the State Water Code, where applicable, before the Planning Commission approves the tentative map for the project.

Wastewater system plans and related technical reports will be submitted to all required County and the State agencies for approval, prior to installing the wastewater system improvements. Maha Development Corporation will pursue approval from the SWRCB once the project has been approved under the requirements of the California Environmental Quality Act (CEQA).

Some portions of the project, such as the large parcels may pursue individual onsite septic systems, and in this circumstance the individual landowner would pursue a permit from Lake County. In other circumstances a landowner of a residential lot may connect to the sanitary sewer system if the soil conditions are not suitable for an individual onsite septic system.

4.4. Lake County Rules and Regulations (LCR) for On-site Sewage Disposal

The Lake County Rules and Regulations for On-site Sewage Disposal are rules adopted in 2010 per the County Code referenced above to prescribe the requirements for on-site sewage disposal systems. This document provides design criteria for standard on-site sewage disposal subsurface systems (LCR 1-130) as well as alternative systems that maybe used in the Project area including subsurface drip disposal systems (LCR 1-155), pressurized distribution systems (LCR 1-160), aerobic systems (LCR 1-195), sand filter systems (LCR 1-190 & LCR 1-200), other media filter (LCR 1-210-215) systems, steep slope systems (LCR 1-220), holding tanks (LCR 1-270), and experimental systems (LCR 1-290).

4.5. Applicable Public Utilities Code (PUC)

The Maha Resort in the Guenoc Valley is planning to form a privately held public utility company that will operate and maintain the water and sewer facilities at the property. Regulated water utilities are considered to be professional water service providers that own water and wastewater utilities, partner with municipalities to form public-private partnerships, or operate and maintain water and wastewater systems as contracted services providers.

In California, these professional water service providers who own and operate utilities are regulated by the California Public Utilities Commission (CPUC). The CPUC establishes rates and terms of service, as well as provides safety and security oversight and, with the State Water Resources Control Board, shares water quality and compliance responsibilities. In the course of regulating these public utilities, the CPUC reviews company costs, audits system needs, holds hearings on general rate cases, applications for capital projects and other formal proceedings, and render decisions that govern the utility's relationship with its customers. The new utility will be regulated by the California Public Utilities Commission. The new water and wastewater utility will initially be a Class C system serving less than 2,000 service connections, and eventually when the Future Phase of development occurs it will likely be a Class B system that will serve between 2000 to 10,000 service connections in the long-term.

Regulated water utilities have more than two centuries of experience providing drinking water to communities of all sizes and in all areas of the United States. Today, nearly 73 million Americans —one of every four people in this country—receive water service from a regulated water utility or a municipal utility operating under a public-private partnership. In California, the regulated water utilities, alone, serve nearly 6 million people, or about one in six Californians. When you add partnerships and contract operations to this total, the percentage grows substantially. There are 138 public utilities in California, including eight Class A utilities with more than 10,000 customers. Many of the larger public utilities own more than one water system, so that the 138 companies own a total of 255 separate systems. Together, public utilities serve almost 5.5 million people in California, 15 percent of the state's population. The largest public utility is California Water Service Company, which serves approximately 1.8 million people through 48 systems.

Public utilities are organized as private corporations, with their stock owned by shareholders for investment purposes. Of the 138 companies operating in California, four are publicly traded, two are owned by investment funds, and the remainder are closely-held businesses. Public utilities are subject to comprehensive regulation by the California Public Utilities Commission regarding water supplies, capital improvements, service quality and water rates.

The Maha Development Corporation will form a privately held water and wastewater public utility company to own, operate and maintain the systems. The Maha Development Corporation will prepare the necessary legal, technical and financial reports needed to form the new utility entity. The new utility company will be permitted and regulated by the CPUC, the SWRCB-DDW, and the CRWQCB.

4.6. State Water Reclamation Requirements for Recycled Water Use

In 2016 the State Water Resources Control Board adopted the State's first General Permit (Order WQ 2016-0068-DDW) for Water Reclamation Requirements for Recycled Water Use. The General Order provides the guidelines and instruction for both public and private parties permit water recycling projects under this streamlined permitting process. The General Permit includes general prohibitions, specifications, administrative requirements, general provisions and instructions for seeking coverage under the General Permit. The General Permit is promulgated under the California Regional Water Quality Control Board and the State Resources Water Control Board-Division of Drinking Water.

The Maha Developments will prepare the necessary plans and technical documents to permit all planned water recycling facilities under the General Water Recycling Permit.

4.7. California Water Code

Several sections of California Water Code, Division 7. Water Quality pertain to the project. Chapter 4, Article 4. Waste Discharge Requirements specify the general requirements for the project to obtain Wastewater Discharge Requirements for the proposed discharge of wastewater. Article 4. Regulation of Reclamation provides regulations pertaining to the use of recycled water. Article 7. Water Reuse specifies the use of recycled water in lieu of potable water for various water demands, such as, landscape irrigation, irrigation of golf courses and other uses.

The Maha Development will be required to prepare and submit a Report of Waste Discharge for the planned wastewater facilities on the property.

4.8. California Code of Regulations – Title 17

Article 2. Protection of Water System sets requirements for back flow preventers to prevent cross-connection or contamination of water systems. The regulations include the requirements for back flow preventer approval, construction of backflow preventers, location of backflow preventers, the type of protection required and the testing and maintenance of backflow preventers.

The Maha Development will need to employee backflow protection measures to prevent the cross-connection and/or contamination of surface water resources or non-domestic water wells. In most cases a reduced pressure principal backflow prevention (RP) type backflow prevention assembly can be used to isolate the recycled water from the other sources of non-potable.

4.9. California Code of Regulations – Title 22, Division 4. Environmental Health

Chapter 3. Water Recycling Criteria defines the type of recycled water and other related topics. Article 3 specifies the water quality requirements for the use of recycled water for irrigation. Article 4. Defines the use area requirements where recycled water can be applied and the setbacks from domestic supply wells for landscape irrigation and for storage of recycled water. Article 6 outlines sampling and analysis requirements. Article 7 outlines the requirement for an engineering report and operational requirements. Article 8 outlines general requirements of design and Article 10 specify requirements for reliability requirements for full treatment.

The Maha Development project will be required to prepare and submit an engineering report that describes the proposed recycled water system and what provisions for reliability and safety will be incorporated in the recycled water system.

The Maha Development project will need to install a water reclamation system that will need to be designed to provide disinfected tertiary recycled water that has filter effluent that does not exceed 2 NTU and influent turbidity does not exceed 5 NTU for more than 15 minutes and never exceeds 10 NTU, and there is a capability to automatically activate chemical addition or diver wastewater should the filter influent turbidity exceed 5 NTU for more than 15 minutes.

4.10. Required Governmental Agency Approvals

- Wastewater System Plan and Technical Reports approved by Lake County and California Regional Water Quality Control Board – Central Valley Region (CRWQCB), State Water Resource Control Board-Division of Drinking Water (SWRCB_DDW). These technical reports should be submitted once the CEQA documents have been approved and certified.
- Operation and Maintenance Plan Approved by CRWQCB and SWRCB-DDW. The O&M Plan should be completed and submitted prior to the startup and commissioning of the new systems.
- Public Water Utility Formation approved by the CPUC and LAFCO. The process to forma private water and wastewater utility should start as soon as the draft CEQA document has been published.
- Water Recycling Permit issued by the CRWQCB (with review by the SWRCB-DDW). Securing the permit should occur after the final CEQA document is certified and prior to occupying the property.

5. Wastewater Flow Analysis

Due to the location of the existing sanitary sewer districts in Lake County (the nearest about 5 miles from the property boundary), the steep slopes and the soil conditions of much of the Project development areas, and the need for reclaimed water for irrigation for the Project, most of the wastewater generated from Phase 1 and future phases will need to be treated in decentralized reclamation plants throughout the Project area. In order to quantify the impacts from the wastewater from the Project, SDE performed a wastewater flow analysis based on an estimate of the various potable water demands at the site. The Project will be designed with onsite collection and pump tanks that feed to both gravity and pressure wastewater lines to convey wastewater to decentralized wastewater reclamation facilities throughout the site.

The following sections include a description of the methodology used to calculate the wastewater flows for the project and results of the calculations.

5.1. Wastewater Flows Calculation Methodology and Results

SDE has completed wastewater flow calculations for both the Phase 1 and future phases projects. The results indicate the amount of recycled or reclaimed wastewater that could potentially be available for non-potable reuse for the project areas (primarily for irrigation). The following section describes the methods used to calculate the projected wastewater flows for the project.

5.2. Wastewater Flows

SDE calculated the projected wastewater flows for the project using the following water demand calculations[4,5] for:

- Domestic and commercial water needs for drinking, cooking, bathing, toilet flushing, and laundry.
- Clean–in-place (wash) water for wineries and other food related production facilities.

Hotel, Resort Villa and Residential Villa Potable Water Demands. SDE employed two methods to calculate the potable water demands for the project: the first method employed unit flow values for hotel rooms and villas based on similar flows obtained from other projects completed by the owner. The second method employed water use values published in technical references for similar types of uses and the expected occupancy rates.

Commercial Retail Space. Water demand values for commercial retail spaces has been calculated based on values published based on the area or square footage of retail and commercial space employed in different jurisdictions in California. [6]

Winery Process Water Demands. Water demand calculations for the winery production is based on the amount of water used per case of wine produced at the winery. SDE used 16 gallons of water required to produce a case or 2.4 gallons of wine.

Emergency Center & Short Term Staff Accomodations	4,140	6,540
Maha Farm	38,829	85,315
Total Wastewater Flow (Gallons per Day)	**170,868**	**314,450**
Total Wastewater Flow (Acre-Feet per Day)	**0.52**	**0.96**
Total Annual Wastewater Flow (Ac-Ft per Year)	**191.37**	NA

Future Phased Wastewater Flows

Future phased development will include additional hotel rooms, resort residential units, residential villas, expanded sport facilities and recreation opportunities. Based on preliminary programming for this future development the wastewater flows estimates have been calculated to be approximately 163 acre-feet of wastewater per year at full buildout and full occupancy as shown in Table 3. The future wastewater flow is estimated to increase the total amount of wastewater to approximately 354 acre-feet per year and will increase the overall wastewater generated by approximately 40 percent.

Table 3. Future Phased Wastewater Flows

Use	Unit	Quantity	Water Demand (gallons)	Average Occupancy Rate (percent)	Average Annual Water Demand (gallons/yr)	Average Annual Water Demand (ac-ft/yr)
1. Resort Facilities	EA	415	300	60%	27265500	83.66
2. Residential Estate Villas	EA	986	280	40%	40307680	123.68

Total Potable Water Demand						**251**
Total Wastewater Flows						**163**

5.2.1. Recycled Water

It is planned that wastewater from all clusters and related areas of development will be collected in sanitary sewer systems and conveyed to a series of small decentralized wastewater reclamation plants. Each plant will be designed to treat wastewater so it can be reused to supply all or a fraction of the landscape irrigation demand in the vicinity to the cluster. Some recycled water will also be reused as makeup water for ornamental ponds and water features. lakes, as 4 presents the amount of recycled that will be available after the Phase I project has been fully developed. The calculations indicate that approximately 162 acre-feet of water will be available to be used for non-potable water use at the property. This will represent between 17% to 18% of the total non-potable water supply for the Phase I project needs.

Table 4. Estimated Recycled Water Supply for Phase I Project

Area	Daily Average Demand (gallons/day)	Annual Demand (gallons/yr)	Annual Volume (ac-ft/yr)	Percent Reuse	Available Recycled Water (ac-ft/yr)
Onsite Workforce Housing	8,064	2,943,360	9.0	0.85	7.68
Equestrian Center	29,805	10,878,825	33.4	0.85	28.37
Red Hill Estates	30,240	11,037,600	33.9	0.85	28.79
Bohn Ridge Resort	16,305	5,951,325	18.3	0.85	15.52
Resort at Trout Flat	14,280	5,212,200	16.0	0.85	13.59
Spa	4,785	1,746,525	5.4	0.85	4.56

Tented Camp	3,960	1,445,400	4.4	0.85	3.77
Central Back-of-House Facilities	17,100	6,241,500	19.2	0.85	16.28
Emergency Center & Short Term Staff Accomodations	4,140	1,511,100	4.6	0.85	3.94
Maha Farm	38,829	14,172,635	43.5	0.85	36.96
Total Annual Volume of Recycled Water					**162.66**

6. Wastewater Management

New wastewater supply infrastructure is being planned for the Maha Resort that will include collecting wastewater from a mixed-use plan of both residential and commercial uses on the property. To accommodate the varied uses and parcel sizes on the project there will be different types of wastewater systems required to manage wastewater flows in the project area. In general, the commercial areas will use a combination of sanitary sewer, wastewater treatment and recycled water systems. The residential areas may include onsite wastewater systems.

6.1. Residential Wastewater Systems

Because of the requirements to conduct site assessment studies for each residential lot including percolation tests and determination of groundwater separation the current project accommodates for both an onsite wastewater solution and/or the option to connect the residential lots to the community wastewater systems. The following sections describe the type of onsite residential systems that are planned for the project.

There are three (3) types of wastewater systems that are acceptable to be implemented at the residential properties on the site. The type of system used will depend on the type of land use, site specific soil and groundwater conditions, and distance or adjacencies to other properties or land uses. The types of wastewater systems that are under consideration for the residential areas at this time include the following:

- Residential System Type 1A – Standard Septic System
- Residential System Type 1B – Onsite Enhance Treatment System
- Residential System Type 1C – Septic Tank Effluent Sewer System

The following provides a brief description of the different types of wastewater **residential** systems planned for the project.

6.1.1. Residential System Type 1A – Standard Septic System

A Type 1A system is a standard septic system that will be used on residential parcels that have suitable soil and groundwater conditions and meets setback requirements that would allow for the installation of a standard septic system (septic tank and subsurface disposal system) that conforms to Lake County Rules and Regulations (LCR) for on-site Sewage Disposal and the State of California's Onsite Wastewater Treatment Systems (OWTS) Policy.

6.1.2. Residential System Type 1B – Onsite Enhanced Treatment System.

A Type 1B system will include an onsite enhanced treatment system (such as an aerobic treatment, textile filter, sand filter or other alternative treatment system) that will provide pretreatment of the wastewater before it is disposed on site in a subsurface disposal system. The enhanced treatment system will be required to address site specific issues, such as marginal soil conditions, high groundwater or other site constraints that will not allow for a standard septic system to be utilized. The enhanced treatment system will designed and operated to comply with both the LCR and the State's OWTS policy.

6.1.3. Residential System Type 1C – Septic Tank Effluent Sewer Systems.

A Type 1C system will include an effluent sewer system to connect a residential parcel to a community wastewater treatment and recycled water system. The effluent sewer system is made up of an interceptor tank (septic tank) and a small-diameter collection pipeline that are designed to convey only the liquid portion of the household wastewater for off-site treatment and disposal or reuse. The septic tank is located close to the house and is used to remove solids from the wastewater and these tanks are periodically pumped by a vacuum truck and the solids are taken to a municipal treatment plant. The settled wastewater can either flow by gravity to the main collection system or a second pump tank with a pump system can be installed and the effluent can be pumped under pressure to the main collection system. The Septic Tank Effluent Gravity (STEP) and the Septic Tank Effluent pumping (STEP) systems would conform with Lake County and State of California's standards.

6.2. Sanitary Sewer, Wastewater Treatment and Recycled Water Systems.

The project is spread out over 16,000 acres and will include at least twelve (12) discrete areas that will require either individual and/or combined wastewater systems. These systems will collect wastewater from commercial and some residential areas.

Several areas will include mixed use developments including hotels, restaurants, commercial centers, pools and other related facilities. Wastewater management systems for these areas will include sanitary sewer collection system to collect the wastewater, small natural or package styled wastewater treatment and reuse systems, and recycled water distribution and reuse systems. The majority of recycled water will be used for landscape irrigation, make up water for water features, and potentially for indirect groundwater recharge via infiltration basins or trenches in selected areas on the property.

Some areas including the main back of the house area, the staff housing area, the fire center and the golf course areas will be smaller areas that are relatively remote from the larger development clusters. These areas will be served by small onsite wastewater systems that will include small sewer collection systems, a small enhanced treatment system and small reuse systems, such as, a subsurface drip dispersal irrigation system to reuse treated water to irrigate landscape around the buildings.

Table 5 presents a list of main project areas, the planned activities in each area, and the wastewater management approach for the area.

~~**Sanitary Sewer Systems.** Based on the variable topography and distances between facilities a combination of pressure and gravity sewer systems will be utilized. The pressurized sewer systems will include small lift stations located in strategic locations to pump wastewater to the main treatment system. Pressure sewers will be small diameter pressure lines that will likely be installed in the road right-of-way or in a utility easement. Gravity sewers will generally be larger diameter pipelines that will also be located in the road right-of-way or a utility easement.~~

~~**Wastewater Treatment and Recycling Systems.** The wastewater treatment and reuse system will include either a natural wastewater treatment system or a small biological package styled treatment system. The wastewater treatment systems will be energy efficient, easy to operate and maintain. The natural wastewater treatment that will be used will include a combined pond~~

~~and wetland treatment system or a small multi-stage trickling filter and wetland treatment system. The small biological package style treatment system will include either a multi-stage trickling filter with a membrane filtration system or packed-bed textile filter and membrane filtration system. All of the wastewater systems will also include advance filtration and disinfection system and inline water quality monitoring system to comply with the State of California's Recycled Water Laws.~~

Recycled Reuse Storage and Distribution Systems. Once the recycled water has been treated it will be stored in small water tanks or ponds. Small booster pumps will pump the recycled water into a purple pipe recycled water distribution system that will convey recycled water to the final point of use, such as a landscape irrigation system, the golf course or polo fields. Anywhere that water recycled water is reused will be posted to inform the visitors and staff that recycled water is being used.

There are several recycled water reuses at the site including but not limited to the following:

- Landscape irrigation;
- Vineyard and orchard irrigation and frost protection;
- Make up water for water features (fountains and reflecting pools);
- Dust control;
- Fire protection;
- Vehicle washing;
- Indoor reuse (toilet flushing, laundry washing, cooling system makeup water)

Table 5. Wastewater Management Approach for Each Cluster Area

Area	Planned Use	Wastewater Management Approach
Hill Hotel	Hotel, restaurant, conference center, sales center, back of house (BOH), central garden, water feature	Sanitary Sewer Collection System, Wastewater Treatment Recycling System and recycled water distribution and reuse
Maha Farm Village	Artisan workshop, restaurants, open air market, post office, bakery, hotel, reception, tasting rooms, public restrooms, winery, pools, gardens	Sanitary sewer collection system, wastewater treatment and recycling system and recycled water distribution and reuse
Spa & Recreational Center	Spa treatment building, male/female day spa, treatment rooms, Beauty and hair saloon, food services, water feature (pond), gardens Indoor & outdoor pools, public restrooms and showers, gym and yoga rooms	Sanitary sewer collection system, wastewater treatment and recycling system and recycled water distribution and reuse
Main Back of House (BOH)	Central laundry, maintenance and service areas, restrooms	• Laundry water graywater recycling system (closed loop) • Onsite wastewater treatment and reuse/disposal system
Staff Housing	Staff Apartments	Onsite wastewater treatment and reuse/disposal system
Fire Center	Staff housing, restrooms, kitchen	Onsite wastewater treatment and reuse/disposal system
Winery	Winery building, crush pad and restroom	Onsite wastewater treatment and reuse/disposal system
Golf Course and Club Houses	Club houses (three at different locations) and golf cart storage and service area, restrooms	Onsite wastewater treatment and reuse/disposal system
Red Hill Hotel	50 room hotel, reception and restroom, two restaurants, bar, winetasting room, pools, boutique, administrative offices, BOH and garden	Sanitary sewer collection system, wastewater treatment and recycling system and recycled water distribution and reuse
Polo Equestrian Center & Villas	Lodge, clubhouse, stables, and villas	Sanitary sewer collection system, wastewater treatment and recycling system and recycled water distribution and reuse
Bohn Ridge Resort	Reception and administration, hotel rooms, restaurant, yoga center, pool and changing room, gardens	Sanitary sewer collection system, wastewater treatment and recycling system and recycled water distribution
Camping Area	Reception, Dining Hall and Bath House	Sanitary sewer collection system, wastewater treatment and recycling system

Each wastewater system will include gravity and pressure collection mains and lift stations to convey the wastewater to a treatment system. Each lift station will include a pump system to convey water where gravity conveyance is not possible. Each treatment system will be a multi-stage treatment system that will treat the water for reuse on the Project site.

Collection System Lift Stations. A series of collection system lift stations will be installed at strategic locations throughout the wastewater systems. The lift stations will be below ground concrete or fiberglass tanks with access risers. The lift stations will be fitted with self-priming sewage pumps. The lift stations storage tanks will be sized to collect and convey the maximum day sewage flows for each area.

The lift stations will be placed in topographically low-lying areas to allow sewage to gravity flow to the tanks. The lift stations will be placed near roads to allow for good access and servicing as required. The location of the tank sites can be selected and planned so that their installation and operation does not impact sensitive cultural, historic, and biotic resources at the site.

Wastewater pump systems will be located at the lift stations and used to convey wastewater to the treatment plants. It is anticipated that each wastewater pump system will include at least two (2) duplex sewage pumps plumbed in parallel. Under low or normal flow conditions it is likely that a single wastewater pump is operating and as the wastewater flow increases the standby pumps will turn on to convey the wastewater to the treatment plant. The wastewater pump systems will be installed in small enclosures and in small areas that should not impact sensitive cultural, historical or biotic resources at the site. The wastewater pumping systems will be connected to the area-wide system control and data acquisition (SCADA) system to allow for both local and remote operation and continuous monitoring.

Wastewater Collection System. The wastewater systems will consist of both gravity and pressurized lines. The wastewater systems will consist primarily of 4-inch to 12-inch diameter sewer mains and 3- and 4-inch laterals to collect wastewater from the commercial building and residential parcels. The majority of the sewer mains and laterals will be installed in the planned roadways and driveways and will not be installed in undisturbed areas on the site. The installation of the wastewater collection system should not result in any additional impacts to cultural, historic or biotic resources related to the installation of the new roads.

Water Reclamation (Recycled) Plants. Based on the decentralized and clustered development plan several small package type water recycling plants will be installed to treat wastewater from the development areas. Seven (7) small package plants are current planned to serve the Phase I project and will include small treatment works at the Maha Farm, Redhill/Renaissance Golf Course, Resort at Trout Flat, Central Back of the House, Equestrian Center, staff housing, and a small system at the Wildlife Camp. Figure 2 shows the approximate location of the seven systems.

The treatment systems will be designed to meet State Title 22 recycled water regulations for tertiary level disinfected recycled water that can be used for unrestricted irrigation and recreational use of the water.

At each water reclamation facility there will be a recycled water tank and booster pump system that will pump recycled water into the non-potable water distribution system for landscape irrigation, fire protection and make up water to ornamental water features.

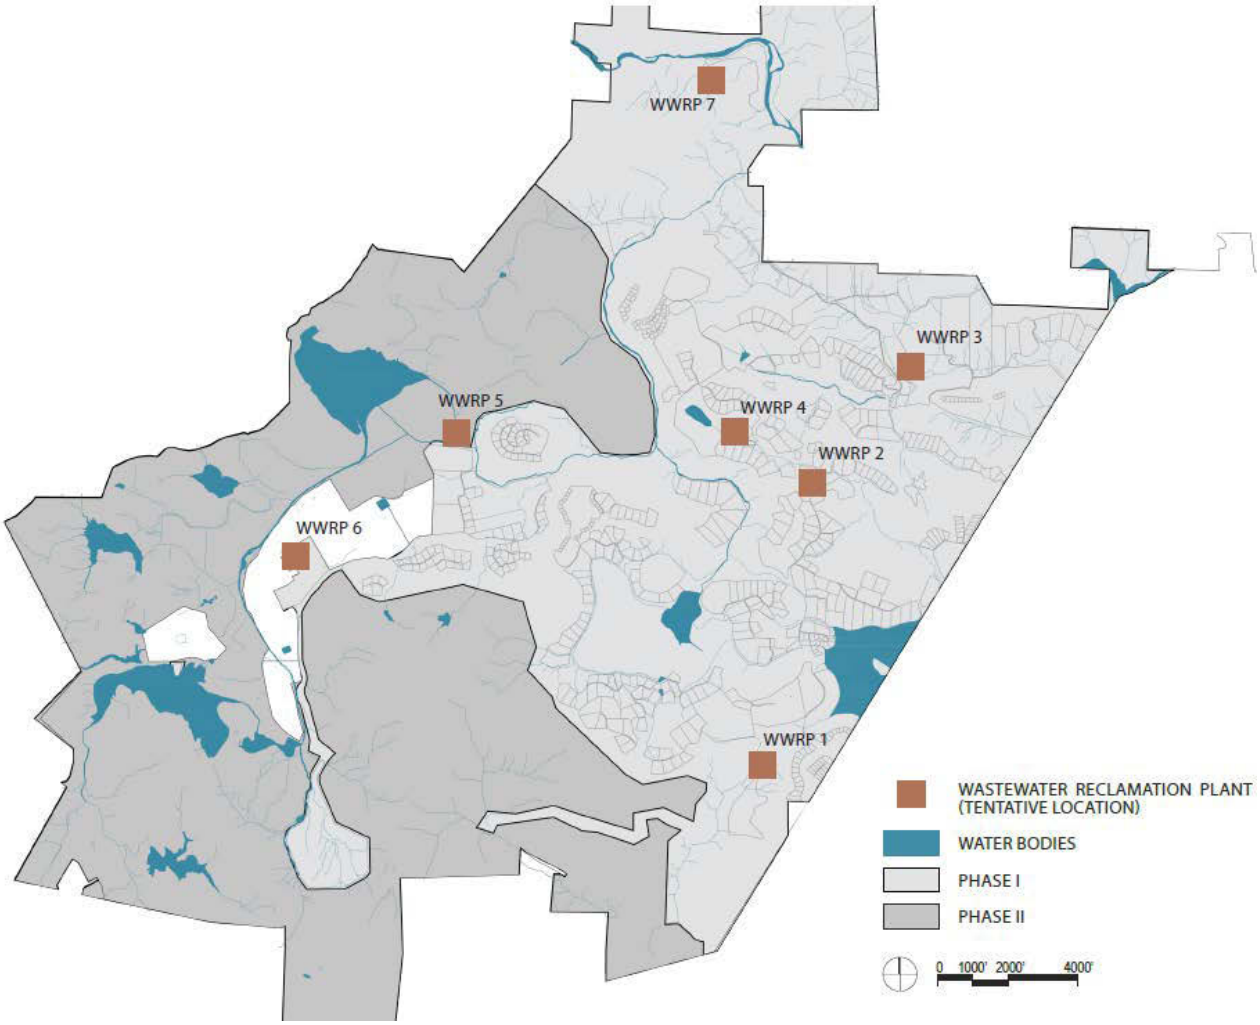

Figure 2. Proposed Approximate Location of Water Reclamation Facilities

Each water reclamation plant will cover a relatively small area ranging from less than 1,500 square feet at the Camping Area to the largest area of 12,500 square feet for the largest system that will serve the Maha Farms area. Figures 3 and 4 shows the typical layout of water reclamation plant facilities serving different flow requirements. Each facility will include a treatment plant, storage tank, booster pump system, and related parking area.

The water reclamation plants will be placed in areas that are set back from the cluster developments to avoid potential odor and noise issues. The plants will be located close to planned roads to provide easy access to them and to avoid the need to construct long driveways or access roads to serve them. The plants will also be placed in areas that will minimize grading and ground disturbance to the extent practical and to avoid impacts to sensitive cultural, historical and biotic resources.

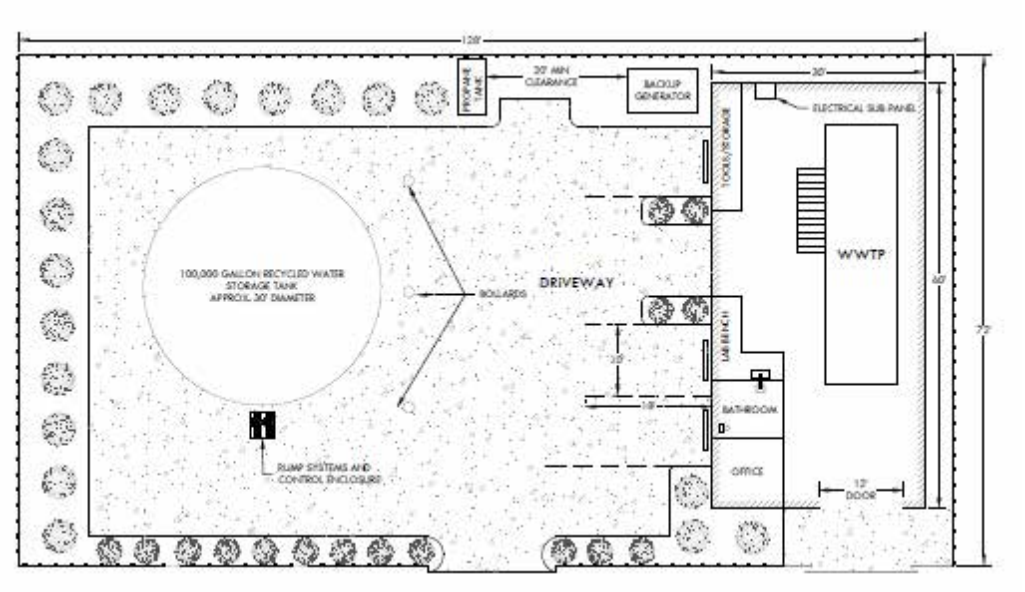

Figure 3. Typical Water Reclamation Facility Layout
- Capacity up to 85,000 Gallon Per Day

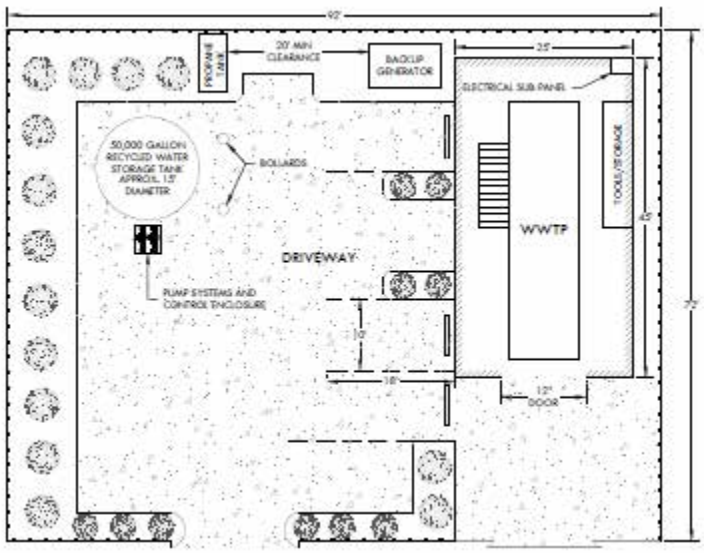

Figure 4. Typical Water Reclamation Facility Layout
- Capacity up to 30,000 Gallons Per Day

7. Analysis of Potential Impacts under the California Environmental Quality Act (CEQA)

This section presents an analysis of the potential impacts related to wastewater systems for the proposed project. In summary, the potential environmental impacts for new wastewater systems should to consider the following issues

1. Can the wastewater improvements be operated and maintain in a manner that does not impact the adjoining properties.

2. Will the propose wastewater facilities and discharge of wastewater be done in a manner that does not impact surface and groundwater at the site.

3. Will the wastewater management practices planned at the project site be consistent with the local and state wastewater management policies for the area? And can the wastewater infrastructure be constructed, operated and maintained to meet the local and state requirements without special conditions of approval?

4. Will the construction and operation of the wastewater systems result in significant environmental impacts to cultural, historical and/or biotic resources.

The following sections address each issue based on the information proved in the previous sections of this wastewater management feasibility study.

7.1. Potential Impacts to Adjoining Properties

All the proposed residential and commercial wastewater facilities are in areas that are remote for adjoining parcels and as planned will not have any potential impacts to the adjoining properties. The design and locations of these facilities will not result in any potential noise or odor nuisance conditions to adjoining property.

7.2. Consistency with Local and State Water Policies and Regulations

The proposed residential and commercial wastewater systems will be designed and operated in accordance with both local and state regulations and standards. The project will not seek any special conditions or variances to meet both local and state standards.

7.3. Recycled Water Policy and Rules

The State Water Resources Control Board supports and encourages the sustainable use of recycled water to promote conservation of water resources. The State's Water Quality Control Policy for Recycled Water was first adopted in 2009 and amended in 2013 and 2018. The project as planned will be consistent with the State's Water Recycling Policy.

The recycled water systems will also be permitted under the State's Water Reclamation Requirements for Recycled Water Use (Order WQ 2016-0068-DDW). The recycled water systems as planned will be consistent with the regulations and standard covered under the State's recycled regulations and associated standards contained in Title 22 Public health rules. The projects will be designed, constructed and operated in accordance with these requirements and as planned will not require any special consideration or variance for approval and permitting.

7.4. Avoidance of Potential Impacts to Cultural, Historical and Biotic Resources

As described in Section 7 the overall wastewater systems will result in decentralized and very localized and small improvements placed at strategic locations of the project site. The majority of improvements will be co-located in areas of other existing and planned improvements, such as installing the sewer collection and conveyance pipelines in the existing and proposed roads and driveways. In some instances, such as the small water reclamation plants and water storage tanks will be placed in small areas typically less than a quarter acre or 12,5000 square feet. These areas will require some site improvements including limited grading and drainage improvements, paving, utilities, and small buildings to house treatment and pumping equipment and related appurtenances.

Based on the amount of land available for these planned facilities, and the studies already conducted, these improvements will be planned to be set back from any significant cultural, historical and biotic resources to avoid any impacts to these resources, if required.

7.5. Avoidance of Potential Impacts to Surface Water and Groundwater Resources

The new commercial wastewater systems will be designed and operated to avoid any potential impacts to both surface and groundwater resources at the site. The majority of wastewater generated at the site will be treated to meet the State's recycled water requirements for tertiary treated wastewater that will produce an effluent with a total nitrogen concentration less than 10 mg/L and the effluent will be disinfected prior to reuse for primary for landscape irrigate purposes. The reuse of high-quality effluent at the site will not impact surface or groundwater resources.

Recycled wastewater will be distributed through a "non-potable" water distribution system. The "non-potable" water distribution system will also convey untreated surface water from the reservoirs on the site and groundwater. A permitted recycled water system will be required by the State to incorporate and maintain reliability features to ensure the safe performance of the recycled water system, such as State approved back flow to prevent cross-connection and contamination of the surface reservoirs and wells by recycled water.

Residential onsite wastewater systems will rely on shallow subsurface disposal systems that will be designed to meet local and state standards for setbacks to surface and separation to groundwater in order to protection these resource on the site.

These measures for both commercial and residential wastewater systems will protection surface and groundwater resources at the site.

8. Summary of Findings and Conclusions

The section provides a summary of the key findings and conclusions related to the project's water supply and feasibility.

1. The wastewater systems will be designed, constructed and operated to comply with local and state water rules for reclaimed water. A reclaimed water permit is required to reuse the wastewater for irrigation.

2. All wastewater systems will be installed and operated so they will not impact water resources on the project site, on the adjacent properties, and will not result in significant impacts as defined under CEQA.

3. All wastewater facilities can be installed and operated in a manner that will avoid any significant impacts to cultural, historical and biotic resources, and will not result in any significant impact as defined under CEQA.

4. The residential lots will have an onsite wastewater system if the results of the site-specific assessment study indicate that an onsite system is feasible. If an onsite system is not feasible the parcel will be connected to a community wastewater system.

5. Future phase of development will require project level CEQA review for final project approval and permitting.
