1.0 PROJECT DESCRIPTION

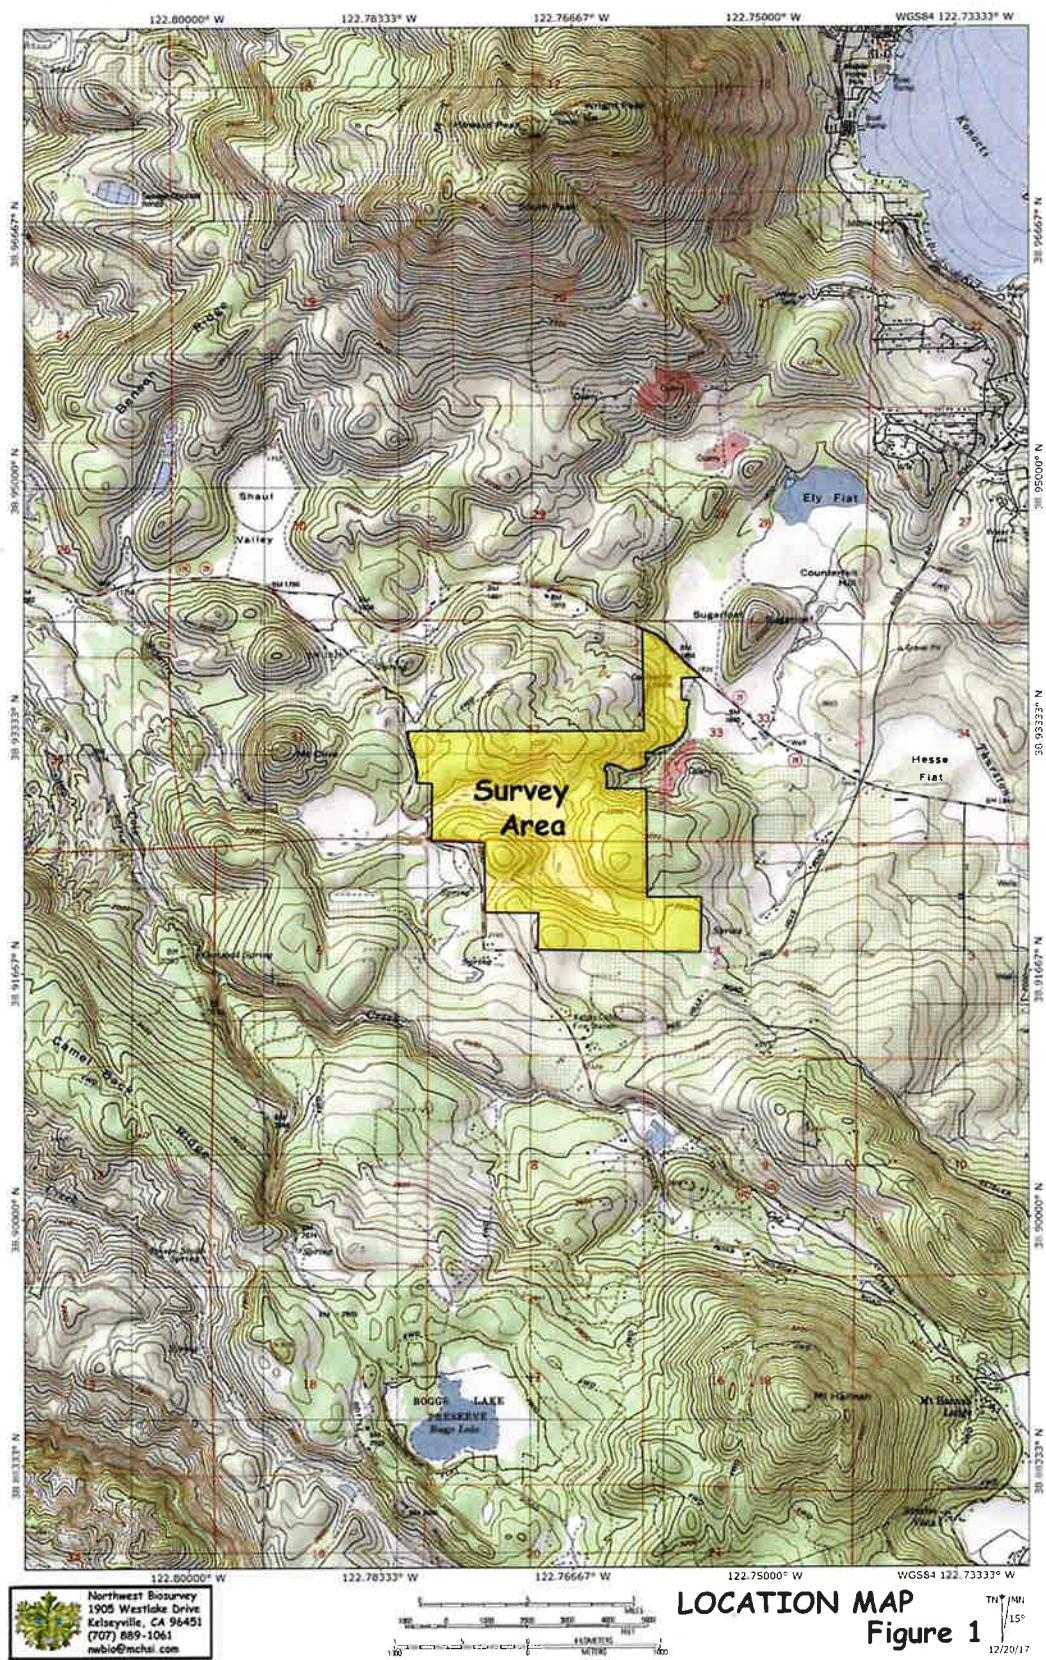

1.1 Proposed Project: This biological resource assessment covers five parcels totaling 638 acres, portions of which are proposed for vineyard development. The local permitting agency is requesting completion of an assessment of biological resources on the property as part of the California Environmental Quality Act (CEQA) review required for development of a vineyard.

The initial phase of this assessment evaluated the potential of the property to contain sensitive plant and wildlife habitat using databases discussed below. The second phase consisted of field surveys for vegetation mapping and habitat analysis. The purpose of the biological resource assessment is to determine whether the property contains sensitive plants or potentially contains sensitive wildlife requiring mitigation under the California Environmental Quality Act (CEQA) or National Environmental Policy Act (NEPA). As used here, the terms sensitive plant or wildlife includes all state or federal rare, threatened, or endangered species and all species listed in the California Natural Diversity Database (CNDDB) list of "Special Status Plants, Animals, and Natural Communities".

In-season botanical surveys for this property were conducted in 2015 and 2016 by another consultant¹, and additional botanical surveys were not requested and are not included in this report. Field botany conducted by Northwest Biosurvey staff was conducted outside of the botanical survey season and was limited to plant identifications required for accurate vegetation mapping. A list of incidental plants identified by us but not included in the original botanical survey is included in this report. Additionally, at the request of the client, a delineation of waters of the U.S. was not conducted.

1.2 Location: The project site is located between Highways 29 and 175 on APNs 09-022-54, 55 & 56, 011-056-01 & 06, Kelseyville, California (T12N R8W Sec. 4 & 5, T13N R8W Sec. 31, 32 & 33; Kelseyville, Calif. 7½' Topographic Map). A location map is provided in **Figure 1**.

¹ Darcie Mahoney, Licensed Forester #2397, Botanical Report 15, June 2015.

2.0 ASSESSMENT METHODOLOGY

The basis of the biological resource assessment is a comparison of existing habitat conditions within the project boundaries to the geographic range and habitat requirements of sensitive plants and wildlife. It includes all sensitive species that occupy habitats similar to those found in the project area and whose known geographic ranges encompass it. The approach is conservative in that it tends to over-estimate the actual number of sensitive species potentially present.

The analysis includes the following site characteristics:

- Location of the project area with regard to the geographic range of sensitive plant and wildlife species
- Location(s) of known populations of sensitive plant and wildlife species as mapped in the California Natural Diversity Database (CNDDB)
- Soils of the project area
- Elevation
- Presence or absence of special habitat features such as vernal pools and serpentine soils

In addition to knowledge of the local plants and wildlife, the following computer databases were used to analyze the suitability of the site for sensitive species:

- California Department of Fish and Wildlife (CDFW), *California Natural Diversity Database (CNDDB)*; RareFind 5, 2017
- California Native Plant Society's (CNPS) *Electronic Inventory of Rare and Endangered Vascular Plants of California*, 2017
- California Department of Fish and Wildlife, *California Wildlife Habitat Relationships System (CWHR)*, Version 9.0

The CNDDB and RareFind 5 databases consist of maps and records of all known populations of sensitive plants and wildlife in California. This data is continually updated by the CDFW with new sensitive species population data.

The CNPS database produces a list of sensitive plants potentially occurring at a site based on the various site characteristics listed above. While use of the CNPS inventory does not in itself eliminate the need for an in-season botanical survey, it can, when used in conjunction with other information, provide a very good indication of the suitability of a site as habitat for sensitive plant species.

The CWHR database operates on the same basis as the CNPS inventory. Input includes geographic area, plant community (including development stage), soil structure, and

special features such as presence of water, snags, cover, and food (fruit, seeds, insects, etc.).

2.1 Survey Methods: A survey of vegetation types was conducted for the project site. In-season botanical surveys had previously been conducted for the project in 2015 and 2016 by a different consultant, and additional botanical surveys were not requested of Northwest Biosurvey. The CNDB report and overlay map for the Kelseyville quadrangle were referenced prior to the survey. Vegetation communities were identified based on the nomenclature of *A Manual of California Vegetation* (Sawyer et al. 2009) as modified by the California Native Plant Society (CNPS), and mapped on a 1"=500' aerial photo. Vegetation community names are based on an assessment of dominant cover species.

Plants occurring on the site were identified using *The Jepson Manual of Higher Plants of California*. Where necessary, species names were updated based on the 6th edition, *CNPS Inventory of Rare and Endangered Plants of California*. A map of the plant communities is provided in **Figure 2**.

2.2 Survey Dates: Site visits for vegetation mapping were made on December 8 and 14, 2017.

2.4 Biological Assessment Staff: The field surveys, plant taxonomy, and vegetation mapping were conducted by Steve Zalusky, Northwest Biosurvey principal biologist. Mr. Zalusky has a Master of Science Degree in Biology from the California State University at Northridge and a Bachelor of Science Degree in Zoology from the University of California at Santa Barbara. Mr. Zalusky has over 30 years of experience as a biologist in the government and private sectors. He completed his wetland delineation training under Terry Huffman of Huffman & Associates, Inc.

Field surveys, database review, and report preparation were conducted with the assistance of Danielle Zalusky, Northwest Biosurvey principal planner. Ms. Zalusky has over 20 years of experience as a planner in local government and the private sector. She has a Bachelor of Arts Degree and has completed all course work toward an M.A. Degree in Rural and Town Planning from Chico State University. Prior to joining Northwest Biosurvey in 2002, Ms. Zalusky served as a senior planner for the Lake County Community Development Department.

3.0 SITE CHARACTERISTICS

3.1 Topography and Drainage: The Stocking Vineyard property lies at the base of a series of low hills constituting the eastern edge of the Mayacamas Mountains at a point where the terrain again rises along the southern slope of Mount Konocti. The property is dominated by two central wetland basins surrounded by low hills. Drainage is primarily internal to these basins, which in turn drain via McIntire Creek. This creek flows west to its confluence with Cole Creek which drains north through the Big Valley to Clear Lake. The property extends north via a narrow "panhandle" to State Highway 29. Slopes here drain east to Thurston Creek, which eventually enters the isolated drainage basin of Thurston Lake. The topography is shown in **Figure 1**.

3.2 Soils: The property contains four soil types, described as follows:

- **Aiken-Sobrante Association, 5-15% slopes (soil unit 101):**
- **Aiken-Sobrante Association, 15-30% slopes (soil unit 102):**

These map units are on hills and mountains. They contain Aiken loam (on north- and east-facing slopes) and Sobrante loam (on south- and west-facing slopes). The Aiken soil is very deep and well drained; it formed in material weathered from basalt. Permeability is relatively slow; surface runoff is medium and the hazard of erosion is moderate. The Sobrante loam is moderately deep and well drained. It formed in material weathered from basalt. Permeability is moderate. Surface runoff is medium, and the hazard of erosion is moderate. These soil units are on the southwestern portions of the property

- **Bottlerock-Glenview-Arrowhead complex, 5-30% slopes (soil unit 117):**

This map unit is on volcanic hills. Vegetation is mainly brush, including manzanita and ceanothus, with scattered conifers. The complex consists of about 50% Bottlerock extremely gravelly loam, 20% Glenview very gravelly loam, and 15% Arrowhead extremely gravelly sandy loam. All soils are deep and well drained and formed in material weathered from obsidian. Permeability ranges from slow to moderately slow, runoff is rapid, and the hazard of erosion is moderate to severe. This soil complex is located on the north and northeastern parts of the property.

- **Clear Lake Variant clay, drained (soil unit 122):**

This very deep soil is in basins. It occurs in the lower wet meadow in the center of the property. It formed under poorly drained conditions; however, drainage has been improved as a result of entrenchment of stream channels. The soil formed in lacustrine deposits derived from mixed rock sources. The soil consists of clay or clay loam to more than 72 inches in depth. Permeability of this soil is slow. Surface runoff is slow and the hazard of erosion is slight. The soil is subject to rare periods of flooding and

ponding during prolonged storms. The shrink-swell potential is high. Natural vegetation includes annual grasses, forbs, and scattered oaks.

3.3 Plant Communities: This project contains fifteen plant communities or vegetation types based on or derived from the "Standardized Classification" scheme described in the California Native Plant Society (CNPS) *A Manual of California Vegetation*. These vegetation types and four other cover types are listed below in **Table 1**. They are described below and shown in the vegetation map provided in **Figure 2**.

- **Ponderosa Pine Forest:**

Ponderosa pine is a subdominant member of the California black oak-ponderosa pine community throughout the southern half of the property. However, on the most densely shaded north-facing slopes ponderosa pine (*Pinus ponderosa*) provides the dominant tree cover. The edges of these pine forests transition into California Black Oak-Ponderosa Pine Forest. The shrub and ground cover layers are the same as those found in the latter community.

- **Knobcone Pine Forest:**

Knobcone pine (*Pinus attenuata*) occurs as small, dense coves of even-aged trees along ridgetops in the northern quarter of the property. The shrub and ground cover layers are suppressed within the community due to dense canopy cover, but community edges support the shrub and ground cover layer of the surrounding Chamise Chaparral and Interior Live Oak Shrub species.

- **Oregon White Oak Woodland:**

This community consists of a relatively narrow band of mature Oregon white oaks (*Quercus garryanna* var. *garryanna*) surrounding the two large central wetlands in the middle of the property. It is generally not more than 2-3 canopy widths wide. The shrub layer is a continuation of the more mesic (moist soil) shrubs from adjacent plant communities. Common snowberry (*Symporicarpos albus* var. *laevigatus*) is prevalent.

The ground cover layer includes hedgehog dogtail (*Cynosurus echinatus*) and bracken fern (*Pteridium aquilinum* var. *pubescens*). It transitions into sedges, Pacific bog rush (*Juncus effusus* var. *pacificus*), and fuller's teasel (*Dipsacus fullonum*) along the wetland edge. Fremont cottonwood (*Populus fremontii* var. *fremontii*) joins the canopy at this edge. The adjacent north slopes transition into Black Oak-Ponderosa Pine Forest; on the south slopes (north of the central wetlands) the community transitions into Interior Live Oak Woodland.

- **California Black Oak-Ponderosa Pine Forest:**

North-facing slopes throughout the property support mature Black Oak-Ponderosa Pine Forest. The tree canopy cover is typically 70%. The subcanopy includes Pacific madrone (*Arbutus menziesii*), interior live oak trees (*Quercus wislizeni* var. *wislizeni*), and California bay (*Umbellularia californica*).

The shrub layer within this community is a mix of common and white-leaf common manzanitas (*Arctostaphylos manzanita* ssp. *manzanita*, *A. m.* ssp. *glaucescens*), birch-leaf mountain mahogany (*Cercocarpus betuloides* var. *betuloides*), and coyotebrush (*Baccharis pilularis*), along with dense thickets of poison oak (*Toxicodendron diversilobum*). California fescue (*Festuca californica*), hedgehog dogtail, field hedge parsley (*Torilis arvensis*), and blue wildrye (*Elymus glaucus* ssp. *glaucus*) make up much of the ground cover.

- **Blue Oak Woodland:**

This comparatively open woodland community occupies a ridgetop in the northern quarter of the property and a south-facing slope in to the south. Blue oak (*Quercus douglasii*) provides a widely dispersed but homogenous tree canopy within a matrix of wild oat grassland. It lacks a true shrub layer but scattered common manzanita and interior live oak shrubs (*Quercus wislizeni* var. *frutescens*) occur among the denser stands of trees. The ground cover is Wild Oat Grassland but also includes scattered woodland grasses and forbs, including slender wild oat (*Avena barbata*), blue wildrye, hedgehog dogtail, and field hedge parsley.

- **Interior Live Oak Woodland:**

Interior live oak occurs primarily as a shrub community² (described below) along the broad, south-facing slope in the northern half of the property. However, the community is developed as a moderate height (20-50 feet) woodland along the northern edge of the reed canary grass wetland and on a shaded slope to the east. This community varies from dense, homogenous stands to transitional mixes of interior live oak, manzanita, birch-leaf mountain mahogany and other shrubs found within the more heterogeneous interior live oak shrub community. The canopy cover is too dense to support shrub or ground cover layers other than leaf litter.

- **Red Willow Thicket:**

Red Willow (*Salix laevigata*) occurs as dense thickets along excavated channels within the southern wetland. This community consists of a homogenous tree canopy

² The distinction between interior live oak trees (*Quercus wislizeni* var. *wislizeni*) and shrubs (*Q. wislizeni* var. *frutescens*) appears to be subjective, at least in field and lab identifications not involving genetic testing. Differences in plant height appear to be far more dependent on soil depth, soil moisture, aspect, and fire history than on genetic variation. The taxonomic distinction is no longer used in Northwest Biosurvey reports. We base the distinction between shrubland and woodland on community structure.

of shrubby red willow, typically surrounded by a dense shrub layer of Himalayan blackberry (*Rubus armeniacus*).

- **Common Manzanita Shrub:**

Several manzanita species occur as the shrub layer throughout the woodland and forest communities on the property; however, in a number of more-exposed locations, or where the tree canopy is open enough to allow it, common manzanita occurs as the dominant member of a distinct shrub community including a mix of other manzanitas and shrubs. These include white-leaf common manzanita, hoary manzanita (*Arctostaphylos canescens* ssp. *canescens*), Stanford manzanita (*Arctostaphylos stanfordiana* ssp. *stanfordiana*), toyon (*Heteromeles arbutifolia*), birch-leaf mountain mahogany, poison oak, and shrubby interior live oak. The canopy is too dense to support a ground cover layer other than leaf litter. Stanford manzanita occurs in the most xeric (dry soil) sites.

- **Chamise Chaparral:**

This nearly-homogenous community of chamise (*Adenostoma fasciculatum*) occupies south-facing slopes throughout the property. Canopy cover is 100%. Included in this community are Stanford and common manzanitas and occasional ghost pines (*Pinus sabiniana*). The canopy is too dense to support a ground cover other than leaf litter.

- **Interior Live Oak Shrub:**

This heterogenous shrub community³ is typically transitional between Chamise Chaparral on the more exposed slopes to Interior Live Oak Woodland on the more shaded slopes. The community consists of a co-dominant mix of shrubby interior live oaks, Stanford and hoary manzanitas, scrub oak (*Quercus berberidifolia*), coyotebrush, chamise, California bay, buck-brush (*Ceanothus cuneatus* var. *cuneatus*), and wavy-leaf ceanothus (*Ceanothus foliosus* var. *foliosus*). The shrub layer is generally too dense to support a ground cover layer. However, openings and community edges support grasses and forbs including nitgrass (*Gastridium phleoides*), silver European hairgrass (*Aira caryophyllea*), desert fescue (*Festuca microstachys*), and goldwire (*Hypericum concinnum*).

- **Blackberry Bramble:**

Dense, homogenous patches of Himalayan blackberry occur along the western edge of the southern reed canary grass wetland. These are too dense to support a ground cover layer. They transition into reed canary grass within the wetlands and to Oregon white oak woodland along their upland edges.

³ ibid footnote 1.

- **Reed Canary Grass Sward:**

The central valley portions of the property consist of saturated wetland basins supporting hydrophytic grasses and forbs. They are surrounded by excavated drainage channels that may have been cut early in the past century. These basins support a broad and homogenous sward of reed canary grass (*Phalaris arundinaceae*). The excavated channels along its edges of these basins support Pacific bog rush, dense green-sheathed sedge (*Carex feta*), white alder (*Alnus rhombifolia*), red willow, and Himalayan blackberry.

- **Broadleaf Cattail Marsh:**

Broadleaf cattail (*Typha latifolia*) occurs within the most mesic areas of the central wetland basins. They occupy sites that are at least perennially saturated if not inundated. These homogenous communities abruptly give way to reed canary grass along wetland edges and into wild oat grassland along their upland edges.

- **Wild Oat Grassland:**

Wild Oat Grassland occurs along the upland edges of the central wetland basins and within woodland openings throughout the property. It also provides the dominant ground cover within most woodland and forest habitats. Grasses include (but are not limited to) slender wild oat, hedgehog dogtail, silver European hairgrass, red brome (*Bromus madritensis* ssp. *rubens*), poverty brome (*Bromus sterilis*), California fescue, and blue wild rye. Bowl-tubed iris (*Iris macrosiphon*), blue dicks (*Dichelostemma capitatum* ssp. *capitatum*), and baby blue eyes (*Nemophila menziesii*) are more common forbs beneath forest and woodland canopy.

- **Fuller's Teasel Patch:**

Fuller's teasel occurs within the more mesic sites along the central wetland basins. Along the northeast shore of the northern wetland, it forms nearly homogenous patches transitional between the reed canary grass sward and wild oat grasslands of the adjacent uplands.

- **Apple Orchard:**

An abandoned apple orchard of decadent trees occurs along the western property entrance and is associated with an abandoned residence.

- **Open Water:**

Perennial open water is limited to an excavated pond in the southern wetland basin. It is surrounded by broadleaf cattail and Himalayan blackberry.

- **Ruderal:**

This term refers to areas disturbed by human activity such as roadways, structures, and parking areas. Within this property it includes two clearings associated with an active quarry along the northeastern tip of the property.

- **Logged Areas:**

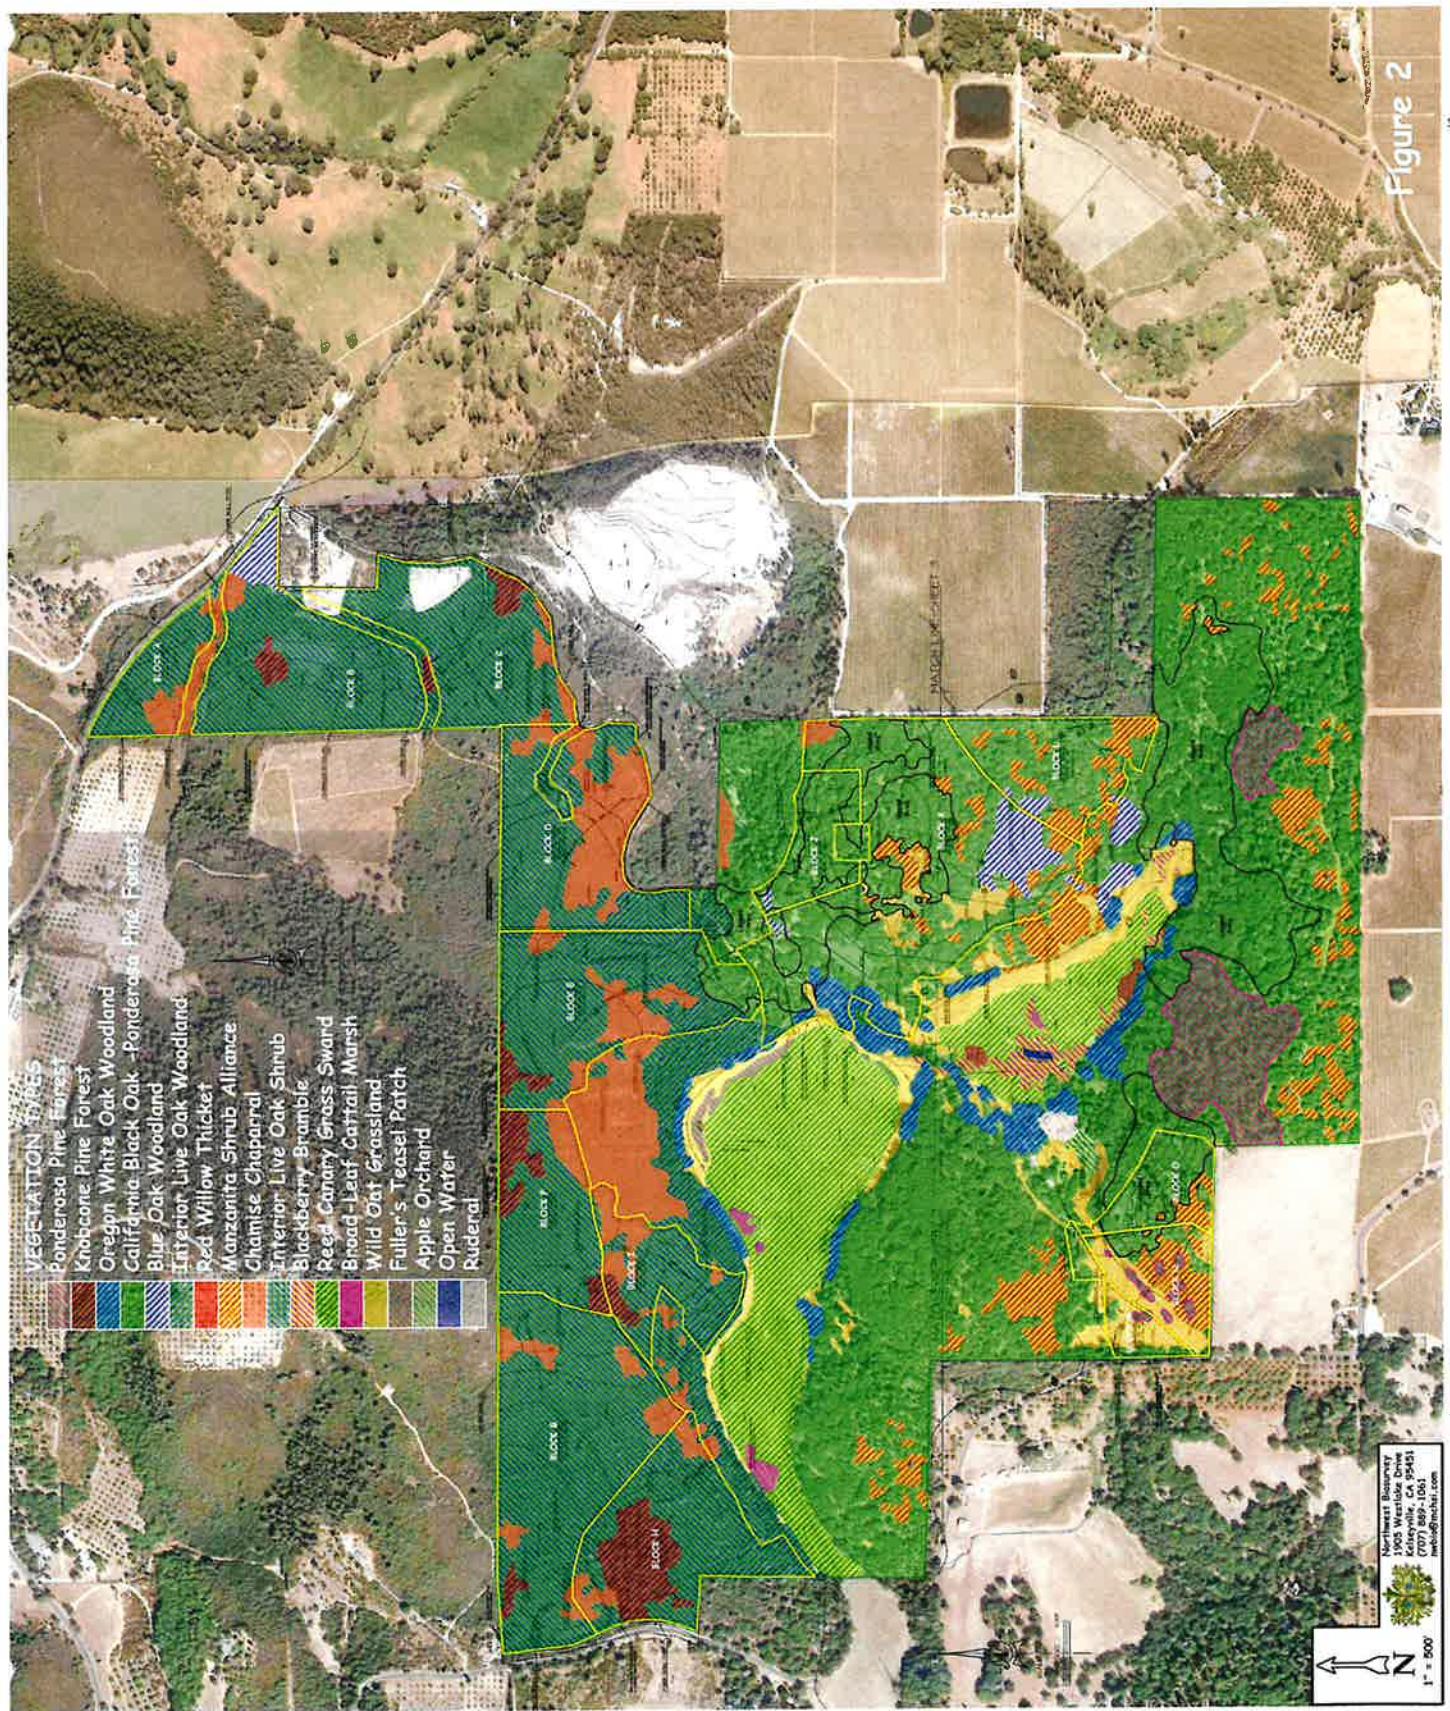

Between 2013 and the present, extensive logging of oaks has occurred primarily within the California Black Oak-Ponderosa Pine Forest community. Within these areas (shown in black outline in Figure 2), all oaks have been removed while scattered ponderosa pines remain. The logged area encompasses 61.78 acres, 60.90 acres of which were black oak forest and 0.88 acres of which were Oregon white oak woodland. This acreage was not included in area estimates for these communities on the property.

TABLE I. VEGETATION TYPES OF THE STOCKING VINEYARD PROJECT

COVER TYPE	Total Acres of Cover Type	Cover Type Percent of Total Property	Acres of Cover Type in Each Block												Acres of Cover Type In all Blocks	Percent of Cover Type In all Blocks			
			A	B	C	D	E	F	G	H	I	J	K	L	M

Figure 2

4.0 PRE-SURVEY RESEARCH RESULTS

4.1 CNPS Electronic Inventory Analysis: A California Native Plant Society (CNPS) analysis was conducted for all plants with federal and state regulatory status, and all non-status plants on the CNPS Lists 1B through 4. The query included all plants within this area of Lake County occurring within the plant communities identified on the project site. The inventory lists species potentially occurring at the site; these are listed in Table 2. These species were included in the list of potentially sensitive species specifically searched for during field surveys. It is important to note that this list includes species for which appropriate habitat is not present on the parcel (including serpentine and vernal pool species). The CNPS database search does not allow fine-tuning for specific soil types and many specific habitats.

4.2 California Natural Diversity Database: The California Natural Diversity Database (CNDDB) and CDFW RareFind 5 data and maps for the Kelseyville 7½' quadrangle were reviewed for this project. Table 3 presents a list of sensitive plant and wildlife species known to occur within this quadrangle. In addition to listing the species present within the quadrangle, the table provides a brief descriptor of the habitat requirements and blooming season, along with an assessment of whether the project area contains the necessary habitat requirements for each species. Appendix A at the end of this report lists the species within the nine quadrangles in the vicinity of this property.

TABLE 2. CALIFORNIA NATIVE PLANT SOCIETY'S INVENTORY OF RARE AND ENDANGERED PLANTS

**Selected CNPS Plants by Scientific Name
B. Stocking Vineyard Project**

Scientific Name	Common Name	Family	Lifeform	CRPR	CESA	FESA	Blooming Period	Habitat
<i>Amsinckia lunaris</i>	bent-flowered fiddleneck	Boraginaceae	annual herb	1B.2	None	None	Mar-Jun	Coastal bluff scrub, Cismontane woodland, Valley and foothill grassland
<i>Antirrhinum subcordatum</i>	dimmorphic snapdragon	Plantaginaceae	annual herb	4.3	None	None	Apr-Jul	Chaparral, Lower montane coniferous forest
<i>Antirrhinum virga</i>	twig-like snapdragon	Plantaginaceae	perennial herb	4.3	None	None	Jun-Jul	Chaparral, Lower montane coniferous forest
<i>Arabis</i> <i>blepharophylla</i>	coast rockcress	Brassicaceae	perennial herb	4.3	None	None	Feb-May	Broadleafed upland forest, Coastal bluff scrub, Coastal prairie, Coastal scrub
<i>Arctostaphylos</i> <i>manzanita</i> ssp. <i>elegans</i>	Konoceti manzanita	Ericaceae	perennial evergreen shrub	1B.3	None	None	(Jan) Mar-May (Jul)	Chaparral, Cismontane woodland, Lower montane coniferous forest
<i>Arctostaphylos</i> <i>stanfordiana</i> ssp. <i>raighei</i>	Raiche's manzanita	Ericaceae	perennial evergreen shrub	1B.1	None	None	Feb-Apr	Chaparral, Lower montane coniferous forest (openings)
<i>Asclepias</i> <i>solaniana</i>	serpentine milkweed	Apocynaceae	perennial herb	4.2	None	None	May-Jul (Aug)	Chaparral, Cismontane woodland, Lower montane coniferous forest
<i>Astragalus</i> <i>breweri</i>	Brewer's milk-vetch	Fabaceae	annual herb	4.2	None	None	Apr-Jun	Chaparral, Cismontane woodland, Meadows and seeps, Valley and foothill grassland (open, often gravelly)
<i>Astragalus</i> <i>clevelandii</i>	Cleveland's milk-vetch	Fabaceae	perennial herb	4.3	None	None	Jun-Sep	Chaparral, Cismontane woodland, Riparian forest
<i>Astragalus</i> <i>rattanii</i> var. <i>jepsonianus</i>	Jepson's milk-vetch	Fabaceae	annual herb	1B.2	None	None	Mar-Jun	Chaparral, Cismontane woodland, Valley and foothill grassland

Scientific Name	Common Name	Family	Lifeform	CRPR	CESA	FESA	Blooming Period	Habitat
<i>Azolla microphylla</i>	Mexican mosquito fern	Azollaceae	annual / perennial herb	4.2	None	None	Aug	Marshes and swamps (ponds, slow water)
<i>Brasenia schreberi</i>	watershield	Cabombaceae	perennial rhizomatous herb (aquatic)	2B.3	None	None	Jun-Sep	Marshes and swamps (freshwater)
<i>Brodiaea rosea</i>	Indian Valley brodiaea	Thymidaceae	perennial bulbiferous herb	1B.1	CE	None	May-Jun	Closed-cone coniferous forest, Chaparral, Cismontane woodland, Valley and foothill grassland
<i>Calamagrostis ophitidis</i>	serpentine reed grass	Poaceae	perennial herb	4.3	None	None	Apr-Jul	Chaparral (open, often north-facing slopes), Lower montane coniferous forest, Meadows and seeps, Valley and foothill grassland
<i>Calochortus uniflorus</i>	pink star-tulip	Liliaceae	perennial bulbiferous herb	4.2	None	None	Apr-Jun	Coastal prairie, Coastal scrub, Meadows and seeps, North Coast coniferous forest
<i>Calycadenia micrantha</i>	small-flowered calycadenia	Asteraceae	annual herb	1B.2	None	None	Jun-Sep	Chaparral, Meadows and seeps (volcanic), Valley and foothill grassland
<i>Calyptridium quadrifolatum</i>	four-petaled pussypaws	Montiaceae	annual herb	4.3	None	None	Apr-Jun	Chaparral, Lower montane coniferous forest
<i>Calystegia collina ssp. oxyphylla</i>	Mt. Saint Helena morning-glory	Convolvulaceae	perennial rhizomatous herb	4.2	None	None	Apr-Jun	Chaparral, Lower montane coniferous forest, Valley and foothill grassland
<i>Calystegia collina ssp. tridactylosa</i>	three-fingered morning-glory	Convolvulaceae	perennial rhizomatous herb	1B.2	None	None	Apr-Jun	Chaparral, Cismontane woodland
<i>Carex praticola</i>	northern meadow sedge	Cyperaceae	perennial herb	2B.2	None	None	May-Jul	Meadows and seeps (mesic)
<i>Ceanothus confusus</i>	Rincon Ridge ceanothus	Rhamnaceae	perennial evergreen shrub	1B.1	None	None	Feb-Jun	Closed-cone coniferous forest, Chaparral, Cismontane woodland
<i>Ceanothus divergens</i>	Calistoga ceanothus	Rhamnaceae	perennial evergreen shrub	1B.2	None	None	Feb-Apr	Chaparral (serpentinite or volcanic, rocky)

Scientific Name	Common Name	Family	Lifeform	CRPR	CESA	FESA	Blooming Period	Habitat
<i>Chlorogalum pomeridianum</i> var. <i>minus</i>	dwarf soaproot	Agavaceae	perennial bulbiferous herb	1B.2	None	None	May-Aug	Chaparral (serpentinite)
<i>Clarkia gracilis</i> ssp. <i>tracyi</i>	Tracy's clarkia	Oenagraceae	annual herb	4.2	None	None	Apr-Jul	Chaparral (openings, usually serpentinite)
<i>Collomia diversifolia</i>	serpentine collomia	Polemoniaceae	annual herb	4.3	None	None	May-Jun	Chaparral, Cismontane woodland
<i>Cordylanthus tenuis</i> ssp. <i>brunneus</i>	serpentine bird's-beak	Orobanchaceae	annual herb (hemiparasitic)	4.3	None	None	Jul-Aug	Closed-cone coniferous forest, Chaparral, Cismontane woodland
<i>Cryptantha dissita</i>	serpentine cryptantha	Boraginaceae	annual herb	1B.2	None	None	Apr-Jun	Chaparral (serpentinite)
<i>Delphinium nudigynum</i>	swamp larkspur	Ranunculaceae	perennial herb	4.2	None	None	May-Jun	Chaparral, Valley and foothill grassland
<i>Eriastrum brandegeei</i>	Brandegee's eriastrum	Polemoniaceae	annual herb	1B.1	None	None	Apr-Aug	Chaparral, Cismontane woodland
<i>Erigeron greenii</i>	Greene's narrow-leaved daisy	Asteraceae	perennial herb	1B.2	None	None	May-Sep	Chaparral (serpentinite or volcanic)
<i>Eriogonum nervulosum</i>	Snow Mountain buckwheat	Polygonaceae	perennial rhizomatous herb	1B.2	None	None	Jun-Sep	Chaparral (serpentinite)
<i>Eryngium cuneifolium</i>	Loch Lomond buttoncelery	Apiaceae	annual / perennial herb	1B.1	CE	FE	Apr-Jun	Vernal pools

TABLE 3. CNDDB SENSITIVE PLANT AND WILDLIFE SPECIES WITHIN THE KELSEYVILLE, CALIF. 7½' QUAD.

Habitat Type	Habitat Present
Clear Lake Drainage Cyprinid/Catostomid Stream	no
Clear Lake Drainage Resident Trout Stream	no
Clear Lake Drainage Seasonal Lakefish Spawning Stream	no
Northern Volcanic Ash Vernal Pool	no

Plant Species	Common Name	Habitat Requirements, Fed/State/CNPS* Status	Blooming Season	Habitat Present
<i>Arctostaphylos manzanita</i> ssp. <i>elegans</i>	Konocti manzanita	Chaparral, cismontane woodland, lower montane conif. forest/volcanic; --/IB.3	March-May everg. shrub	Habitat present
<i>Arctostaphylos stanfordiana</i> ssp. <i>raichei</i>	Raiche's manzanita	Chaparral, lower montane coniferous forest/rocky, often; --/IB.1	Feb.-April ann. herb	Habitat present
<i>Astragalus breweri</i>	Brewer's milk-vetch	Chaparral, cismontane woodland, meadows and seeps, valley and foothill grassland (open, often gravelly)/often serpentine, volcanic; --/4.2	April-June ann. herb	Habitat present
<i>Azolla microphylla</i>	Mexican mosquito-fern	Marshes and swamps (ponds, slow water); --/4.2	August ann./per. herb	Habitat present
<i>Brasenia schreberi</i>	watershield	Marshes & swamps/freshwater; --/2.3	June-Sept. rhizom. herb, aquatic	Habitat present
<i>Calyptidium quadripetalum</i>	four-petaled pussypaws	Chaparral, lower montane coniferous forest/sandy or gravelly, usually serpentine; --/4.3	April-June ann. herb	Moderate habitat present
<i>Clarkia gracilis</i> ssp. <i>tracyi</i>	Tracy's clarkia	Chaparral (openings, usually serpentinite); --/4.2	April-June ann. herb	Poor to moderate habitat
<i>Cordylanthus tenuis</i> ssp. <i>brunneus</i>	serpentine bird's-beak	Closed-cone coniferous forest, chaparral, cismontane woodland/usually serpentine; --/4.3	July-Aug. ann. herb	Poor to moderate habitat

Plant Species	Common Name	Habitat Requirements, Fed/State/CNPS* Status	Blooming Season	Habitat Present
<i>Eriastrum brandegeae</i>	Brandegee's eriastrum	Chaparral, cismontane woodland, valley & foothill grassland/often serpentine; --/IB.1	April-Aug. ann. herb	Poor to moderate habitat
<i>Gratiola heterosepala</i>	Boggs Lake hedge-hyssop	Freshwater marsh, marsh & swamp, vernal pool, wetland; --/SE/IB.2	April-Aug. ann. herb	moderate
<i>Hesperolinon adenophyllum</i>	glandular western flax	Chaparral, cismontane woodland, valley & foothill grassland/serpentine; --/IB.2	May-Aug. ann. herb	Habitat not present
<i>Horkelia bolanderi</i>	Bolander's horkelia	Cismontane woodland, lower montane conif. forest, meadows & seeps, valley & foothill grassland/edges; --/IB.2	June-Aug. per. herb	Habitat present
<i>Lasthenia burkei</i>	Burke's goldfields	Meadows and seeps, vernal pools, wetland; FE/SE/IB.1	April-June ann. herb	Habitat not present
<i>Layia septentrionalis</i>	Colusa layia	Chaparral, cismontane woodland, valley & foothill grassland/sandy, serpent.; --/IB.2	April-May ann. herb	Habitat not present
<i>Legenere limosa</i>	legenere	Vernal pool; --/IB.1	April-June ann. herb	Habitat not present
<i>Leptosiphon aciculatus</i>	bristly leptosiphon	Chaparral, cismontane woodland, coastal prairie, valley and foothill grassland; --/4.2	April-July ann. herb	Habitat present
<i>Limnanthes floccosa</i> ssp. <i>floccosa</i>	woolly meadowfoam	Chaparral, cismontane woodland, valley & foothill grassland, vernal pools/vernally mesic; --/4.2	March-May (June) ann. herb	Poor habitat
<i>Microtus amphibolus</i>	Mt. Diablo cottonweed	Broadleaved upland forest, chaparral, cismontane woodland, valley & foothill grassland /rocky; --/3.2	March-May ann. herb	Habitat present
<i>Monardella viridis</i>	green monardella	Broadleaved upland forest, chaparral, cismontane woodland; --/4.3	June-Sept. rhizom. herb	Habitat present
<i>Navarretia leucoccephala</i> ssp. <i>pauciflora</i>	few-flowered navarretia	Volcanic ash flow vernal pools, wetlands; FE/ST/1B.1	May-June ann. herb	Habitat not present
<i>Navarretia leucoccephala</i> ssp. <i>pileantha</i>	many-flowered navarretia	Volcanic ash flow vernal pools, wetlands; FE/SE/1B.2	May-June ann. herb	Habitat not present
<i>Orcuttia tenuis</i>	slender orcutt grass	Vernal pools; FT/SE/IB.1	May-Oct. ann. herb	Habitat not present

Plant Species	Common Name	Habitat Requirements, Fed/State/CNPS* Status	Blooming Season	Habitat Present
<i>Potamogeton zosteriformis</i>	eel-grass pondweed	Marshes & swamps, wetlands; --/-/2B.2	June-July ann. herb aquatic	Habitat present
<i>Streptanthus barbiger</i>	bearded jewel flower	Chaparral/serpentine; --/-/4.2	May-July ann. herb	Habitat not present
<i>Trichostema ruygtii</i>	Napa bluecurls	Chaparral, dismontane woodland, lower montane conif. forest, valley & foothill grassland, vernal pools; --/-/1B.2	June-Oct. ann. herb	Habitat present

Wildlife Species	Common Name	Habitat Requirements, Status	Season Present	Habitat Present
<i>Calasellus californica</i>	an isopod	Aquatic: freshwater wells & springs. One occurrence from Kelseyville in 1931; G2/S2	year-round	Poor
<i>Bombus caliginosus</i>	obscure bumble bee	A black and yellow bee found in California, Oregon, Washington; G3G4/CA-SNR	year-round	Potential habitat present
<i>Hydrochara rickseckeri</i>	Ricksecker's water scavenger beetle	Aquatic beetle that lives in slow-flowing streams, shallow open water, springs, stagnant ponds, & vernal pools; G2/S2	year-round	Habitat not present
<i>Lavinia exilicauda chi</i>	Clear Lake hitch	Riparian/aquatic: partly-shaded, shallow streams & riffles with a rocky substrate in variety of habitats; SSC/ST/C4/S1	year-round	Habitat not present
<i>Rana boylii</i>	foothill yellow-legged frog	Riparian/aquatic: partly-shaded, shallow streams & riffles with a rocky substrate in variety of habitats; SSC/SCT/G3/S2;3	year-round	Habitat present
<i>Taricha rivularis</i>	red-bellied newt	Occurs near high to moderate gradient streams and rivers, riffles, pools. Burrows in soil or debris near water, emerges during fall rains to water to breed; G4/SNR	year-round	Habitat not present
<i>Emys marmorata</i>	western pond turtle	Aquatic turtle found in ponds, lakes, rivers, creeks, marshes & irrigation ditches with abundant vegetation and rocky or muddy bottoms; In woodland, forest, & grasslands; SSC/G3G4/S3	year-round	Habitat present

Wildlife Species	Common Name	Habitat Requirements, Status	Season Present	Habitat Present
<i>Pandion haliaetus</i>	osprey	Large, fish-bearing waters usually in mixed conifer habitats; WL/G5/S4	sometimes migratory	Nesting habitat not present
<i>Progne subis</i>	purple martin	Open woodland near water; SSC/G5/S3	migratory in winter	Habitat present
<i>Erethizon dorsatum</i>	North American porcupine	Conifer and hardwood forests are preferred, uses fallen and standing dead trees as cover; G5/SNR	year-round	Habitat present

4.3 Wildlife Habitat Analysis Results: The California Wildlife Habitat Relationships analysis lists a large number of species with sensitive and non-sensitive status as potentially occurring on the site based on the geographic location and wildlife habitats present. This list is included as **Appendix B**.

4.4 Wildlife Assessment: Based on the pre-survey research conducted for this study, ten sensitive wildlife species need to be accounted for within the project area based on their identification as present within the Kelseyville quadrangle by the CNDDDB. Additional species are added based on the results of the CWHR, the presence of appropriate habitat, and their occurrence in the region. Accepted protocol requires that all CNDDDB species in the surrounding U.S.G.S. quadrangle be discussed even though suitable habitat may not occur on the site.

- ***Calasellus californicus* (a freshwater isopod):**

Found in freshwater habitats; the known collections are from a freshwater well and two springs in 1933. Habitat for this crustacean is poor on this property.

- ***Obscure bumble bee (Bombus oliginosus)*:**

This bumblebee is native to the west coast; in the Coast Range it inhabits meadows. It is similar in appearance and co-exists with the common *Bombus vosnesenskii* and may be mistaken for this bee. *B. oliginosus* is threatened by climate change and loss of habitat, and does not thrive in developed urban or agricultural areas. Potential habitat for this species may occur in the wetlands on the property.

- ***Ricksecker's water scavenger beetle (Hydrochara rickseckeri)*:**

This species is known from accounts in the San Francisco Bay Area. It occupies ponds and shallow waters of streams, lakes, or marshes. This species is listed here because it was identified near Boggs Lake in Lake County. There is no suitable habitat for this beetle within the project area.

- ***Clear Lake hitch (Lavinia exilicauda chi)*:**

Clear Lake hitch are a California Species of Concern and currently have State Threatened Species status. Hitch are fish of lakes and slow-moving streams. There are no perennial streams in the project area and the site is far from Clear Lake.

- ***Foothill yellow-legged frog (Rana boylii)*:**

These frogs are relatively common along the shaded banks of perennial headwater streams. They are heavily dependent on the presence of perennial water and are seldom far from pools where they can seek shelter from predation. The larvae require three to four months to mature, making most ephemeral (seasonal) streams unsuitable as breeding sites.

Foothill yellow-legged frogs are found throughout Kelsey Creek and its tributaries, and have been identified along Highway 175. McIntire Creek runs through the low area on the property and although it appears to have been altered, it may support this species as long as flows are high enough.

- **Red-bellied newt (*Taricha rivularis*):**

This species is often found under rocks, logs, soil or duff, or in rodent burrows in coastal woodlands and redwood forests. Newts occur near high-to-moderate gradient streams and rivers, in riffles, and pools. They usually breed in flowing water. These animals burrow in soil or debris near water, and emerge to water during fall rains to breed; they may migrate up to a mile or more between terrestrial habitat and stream breeding sites. They have been identified in the Cobb Mountain area along Bottle Rock Road. Appropriate habitat does not occur on the project site.

- **Western pond turtle (*Actinemys marmorata*):**

These turtles prefer slow or ponded water with sheltering vegetation but will range widely through less suitable habitat in search of these sites. Eggs are laid on land in sheltered nests. Young overwinter in the nest and emerge the following spring in Northern California. When present, pond turtles are readily observed basking along shorelines or on logs in shallow water. McIntire Creek may provide a suitable movement corridor for turtles and they may occur within the small pond on the property.

- **Osprey (*Pandion haliaetus*):**

This species occurs near large, fish-bearing waters in ponderosa pine or mixed conifer habitats where it feeds on open waters for fish, although it also takes small birds and mammals. It hunts over wide expanses of open water and usually nests in the tops of large isolated trees near shorelines. Nests are made on platforms of sticks on top of large snags, dead-topped trees, or man-made structures, usually within close proximity of large fish-producing water bodies. The stick nests constructed by this species are readily apparent when present. This site lacks suitable nesting habitat for the osprey. This species' sensitive status pertains to nesting pairs. This species no longer has sensitive status, but is protected under the Migratory Bird Treaty Act and California Department of Fish and Game code.

- **Purple martin (*Progne subis*):**

These migratory passerine (perching) birds prefer open, old growth, multilayered woodland with nearby water. Much is known about habitat preference in this species due to recent research. They are commonly found in riparian habitat, or valley foothill with montane hardwood or montane-hardwood-conifer habitats near water. Up to

70-percent of nests are in fire-killed firs and pines. Most tree nest sites are located in the upper slopes of hilly and mountainous terrain and Northwest Biosurvey staff has found this species in habitat meeting these requirements in the Geysers area of Lake and Napa Counties. There is a potential for purple martins to be present in the forests and remaining oak woodlands on the property, especially where snags remain.

- **North American porcupine (*Erethizon dorsatum*):**

This species prefers conifer and hardwood forests and woodlands, but is also found in forested wetlands and chaparral. It uses downed logs and debris, as well as snags and tree hollows, as cover. The porcupine breeds from September to November or December, giving birth in the spring. One offspring is reared a year. *E. dorsatum* is herbivorous; its diet consists of many parts of trees and other plants including bark, needles, flowers, roots, berries, leaves, and seeds. It is mostly nocturnal. The large amount of woody debris and other vegetation on the property may provide suitable habitat for porcupines. This species is listed in the CNDDB as "G5" (Global Secure) and "SNR" (Species not Rated-California). It is therefore not a species with sensitive regulatory status although its local accounts are included in the database.

- **Pallid bat (*Antrozous pallidus*):**

This is a pale bat with a dog-like face. Optimal habitat for these bats consists of open, dry habitats with rocky areas, but the bats are also found in oak savanna grasslands, and in open forest and woodlands with access to riparian and open water for feeding and drinking in northern California. Foraging occurs over open country. These bats prefer the cool summer temperatures of caves, crevices, and mines as roosting sites where they are known to wedge themselves into small spaces; they will also roost in buildings, bridges, and hollow trees. Preferred roosts are high above the ground and inaccessible to terrestrial predators, although they are occasionally found roosting on the ground underneath sacks and other items left by humans.

Pallid bats take a variety of prey, including insects, reptiles, and rodents. Maternity colonies tend to be in the more protected, isolated locations and may consist of more than 100 individuals. The bats have a home range of 1 to 3 miles and are known to roost with other bat species. This species of bat does not migrate long distances between seasons. This species is extremely sensitive to human disturbance of roosting sites. Populations in California have declined due to habitat destruction and use of pesticides. There is a potential for pallid bats or other bat species to roost in the woodlands, especially if there are ponds in the vicinity of the property.

Raptors and passerines with non-sensitive status are likely to nest on the property due to the diverse woodland and forest habitats there. These would include: red-tailed hawks (heard during surveys), crows and ravens, Cooper's hawks, northern harriers, tri-colored

blackbirds (potentially in the cattails within the wetland), woodpeckers, yellow-breasted chats, and yellow warblers. Much of the original oak woodland has been removed in the past few years, leaving open pine forest in many locations, but downed wood, snags, and large trees remain in many parts of the property and may be used by a wide variety of wildlife.

No wildlife surveys were conducted as part of this assessment. All nesting raptors are protected under the Migratory Bird Treaty Act and Fish and Game Code.

5.0 FIELD SURVEY RESULTS

In-season floristic-level botanical surveys were conducted for this project in 2015 and 2016 by Darcie Mahoney, Licensed Forester #2397, Botanical Report 15, June 2015 & 23 June 2016. No additional in-season botanical surveys were conducted. However, some additional plants were identifiable during our December surveys; these are listed below.

Ms. Mahoney identified an individual plant to the level of genus *Piperia*. Of the six species of this genus found in this region, three are CNPS Rank 4. Rank 4 is a watch list of species about which not enough is known to list as sensitive. The location is described as "adjacent a side road in the forested habitat". We were unable to contact Ms. Mahoney to get a more detailed description of the location.

**TABLE 4. ADDITIONAL PLANT SPECIES IDENTIFIED, OR CLARIFIED SPECIES NAMES
BRYANT STOCKING VINEYARD PROPERTY**

Habit	Species	Common Name	Family	Origin
fern	<i>Pteridium aquilinum</i> var. <i>pubescens</i>	bracken fern	Dennstaedtiaceae	N
forb	<i>Dipsacus fullonum</i>	fuller's teasel	Dipsacaceae	A
forb	<i>Juncus effusus</i> var. <i>pacificus</i>	Pacific bog rush	Juncaceae	N
grass	<i>Elymus glaucus</i> ssp. <i>glaucus</i>	blue wildrye	Poaceae	N
grass	<i>Festuca microstachys</i>	desert fescue, small fescue	Poaceae	N
grass	<i>Castridium phleoides</i>	nitgrass	Poaceae	A
shrub	<i>Arctostaphylos manzanita</i> ssp. <i>glaucescens</i>	white-leaf common manzanita	Ericaceae	N
shrub	<i>Arctostaphylos manzanita</i> ssp. <i>manzanita</i>	common manzanita	Ericaceae	N
shrub	<i>Quercus wislizenii</i> var. <i>frutescens</i>	interior live oak	Fagaceae	N
shrub	<i>Rubus armeniacus</i>	Himalayan blackberry	Rosaceae	A
tree	<i>Arbutus menziesii</i>	Pacific madrone	Ericaceae	N
tree	<i>Quercus garryanna</i> var. <i>garryanna</i>	Oregon white oak	Fagaceae	N

tree	<i>Salix laevigata</i>	red willow	Salicaceae	N

Origin: N = Native, A = Alien

6.0 SUMMARY AND RECOMMENDATIONS

6.1 Summary: This biological resource assessment involved the following analyses for sensitive plants and wildlife potentially occurring in the vicinity of the project:

- Review of current California Natural Diversity Database (CNDDDB) mapping of known sensitive plant and wildlife populations within the region
- An analysis of the suitability of the site for sensitive plants and wildlife using the California Native Plant Society On-line Inventory of Rare and Endangered Vascular Plants of California, and the California Department of Fish and Wildlife's Wildlife Habitat Relations System
- Vegetation mapping

Sensitive Plants: The 2015 and 2016 botanical surveys conducted by Darcie Mahoney identified an individual plant to the level of genus *Piperia*. Of the six species of this genus found in this region, three are CNPS Rank 4. Rank 4 is a watch list of species about which not enough is known to list as sensitive. The location is described as "adjacent a side road in the forested habitat". We were unable to contact Ms. Mahoney to get a more detailed description of the location.

Sensitive Wildlife: A total of eleven sensitive wildlife species were assessed for potential occurrence at the site because of inclusion in the CNDDDB database for the Kelseyville quadrangle, the CWHR database, the presence of appropriate habitat, and their occurrence in the region. Five of these have a potential to occur on the property. These are:

- Obscure bumble bee: wetland habitat
- Foothill yellow-legged frog: McIntire Creek, wetland, small pond
- Western pond turtle: McIntire Creek, small pond
- Purple martin: Oak woodlands and pine forest
- Porcupine: Pine forest
- Pallid bat: Oak woodlands

Sensitive Habitat: The property contains two central wetland basins which have been excluded from the proposed vineyard block design.

Possible Waters of the U.S.: At the request of the client, a delineation of waters of the U.S. was not conducted for this project. Waterways contiguous with McIntire Creek, including the two central wetland basins are likely to qualify as Waters of the U.S.

6.2 Recommendations:

1. Sensitive Wildlife:

➤ Obscure Bumblebee, Foothill Yellow-legged Frog, Western Pond Turtle:

Potential Impacts: Any vineyard construction activity resulting in the loss of wetland habitat in the central basins of the property or resulting in direct impacts to McIntire Creek or the small pond has a potential to result in an incidental take of these state species of special concern. However, the proposed vineyard block design has specifically excluded the central wetland basins, McIntire Creek, and the pond.

Proposed Mitigation: The project design reviewed in this study⁴ avoids impacts to McIntire Creek, the central wetland basins, and the small pond as shown in Figure 2 of this report. This plan should not be modified in a manner that would impact these resources.

➤ Purple Martin, Raptors, Migratory Birds:

Potential Impacts: Clearing or grading within woodland or forest habitat during the breeding season (February 15 through August 31) has a potential to result in an incidental take of these special status species.

Proposed Mitigation: Any vegetation clearing or grading within 200 feet of woodland habitat between February 15 and August 31 should be preceded by a survey for nests of purple martin, raptors, and migratory birds conducted by a qualified biologist. In the event that active nests of these species are found, appropriate breeding season construction buffer shall be established and construction within these buffers should be delayed until after August 31, or until fledging is completed as determined by a qualified biologist. As an alternative, trees approved for removal shall be felled outside of the breeding season.

⁴ "Stocking Vineyards 7765 State Hwy 29 Erosion Control Plan for New Vineyard" by Napa Valley Vineyard Engineering, Inc. May 12, 2017.

➤ **Pallid bat:**

Potential Impacts: Removal of trees providing bat habitat during the maternity roosting season (April 1 through September 15) has the potential to result in an incidental take of pallid bats.

Proposed Mitigation: If work is proposed within woodland habitat during the maternity roosting season (April 1 through September 15), trees with features capable of supporting roosting bats shall be surveyed by a qualified biologist for bat roosts or evidence of bat roosting (guano, urine staining, dead bats) within 14 days of the start of project activities or removal of vegetation. If active roosts are discovered, an exclusion buffer would be established around the active roost by a qualified bat biologist.

Removal of trees and ground-disturbing activities should be performed to the extent possible from September 16 through March 31, outside of the maternity roosting season. Following the felling of any tree or snag, the tree or snag should be allowed to remain on the ground for 24 hours prior to chipping or removal to allow any bats to escape.

2. Sensitive Plant Populations:

➤ ***Piperia* genus:**

Botanical surveys conducted in 2015 and 2016 by Registered Forester Darcie Mahoney identified a single individual of the genus *Piperia*. However, the plant was not keyed to species. Of the six species of this genus that occur in this region, three have a CNPS Rank of 4. Rank 4 is a watch list of plants about which not enough is known to list them as sensitive taxa. The location description was described as "adjacent to a roadway in a forested area". Efforts to contact the forester for additional information were not successful.

Potential Impacts: If this plant is sensitive, its removal would qualify as an incidental take. However, it is questionable that if it is a Rank 4 species, the loss of a single individual would qualify as a significant impact within the context of the CEQA Guidelines. It remains possible, or likely, however, that this plant is part of a larger population that was not located during the botanical surveys.

Proposed Mitigation: If it is determined by regulatory reviewers that an incidental take of this individual or population has the potential to be significant within the context of the CEQA Guidelines, it is recommended that the location of this plant be accurately identified. If the plant is keyable at the time its location is identified a determination can be made regarding its regulatory status. If the plant is not keyable, or is determined to be a Rank 4 taxon, the plant or population can be protected with an appropriate construction buffer. If such a buffer is not practical based on its location relative to proposed vineyard blocks, alternative mitigation may consist of locating and protecting a population of this taxa elsewhere on the property if available.

3. Woodlands and Forest

Potential Impacts: **Table 1** provides a list of the acreage of all vegetation types on the Stocking Vineyard property along with the acreage and percentage of each of these plant communities within the proposed vineyard blocks. The property contains a total of 267.88 acres of woodland and forest distributed among six different plant communities. The proposed vineyard blocks contain a combined total of 72.27 acres (27%) of the remaining woodland and forest on the property.

Consistent with the Oak Woodlands Conservation Act, the lead agency will need to determine whether loss of this woodland acreage constitutes a significant adverse impact on the environment as defined within the CEQA Guidelines.

Proposed Mitigation: If it is determined that project-related impacts to woodlands are significant within the context of the CEQA Guidelines, one or more of the following mitigations is recommended.

- a) **Avoidance and Minimization:** The vegetation map provided in Figure 2 can be used as a planning tool in the modification of the vineyard block design to reduce impacts to woodland and forest. Vineyard block design would reduce impacts to these resources by emphasizing use of chamise chaparral, interior live oak shrub, and existing clear-cut woodland (as mapped in Figure 2).
- b) **Establishment of Woodland Conservation Areas:** Oak woodlands outside of the proposed vineyard blocks should be considered as woodland conservation areas. These conservation areas should be

permanently excluded from future development through permit conditions, recorded easements, or other methods consistent with local land use regulations.

4. Habitat Fragmentation

Potential Impacts: Vineyard development that transects woodlands and waterways has a potential to restrict wildlife movement and disrupt continuity with surrounding habitats. With the exception of extensive clear-cut areas, the property supports a belt of continuous black oak and ponderosa pine forest along its southern perimeter. All of this similar habitat has been removed from adjacent properties for vineyard development.

The principal wildlife movement corridor in the area is provided by the open wetland habitats and adjacent woodland and McIntire Creek riparian habitat of the central basins (mapped as Reed Canary Grass Sward and Wild Oat Grassland in Figure 2). Based on the current vineyard development plan⁵, this habitat will remain intact.

Proposed Mitigation: It is recommended that the remaining belt of black oak and ponderosa pine forest along the property's southern perimeter remain intact. Vineyard development here should emphasize use of existing clear-cut areas.

No modifications should occur in the proposed vineyard development plan that would result in direct impacts to the central woodland basins, McIntire Creek, and the adjacent band of woodland habitat.

Fencing should be restricted to vineyard blocks. Fencing along roadways or other linear features such as property boundaries should be avoided if not directly associated with vineyard blocks.

5. Waterways:

Potential Impacts: A wetland delineation was not conducted as part of this biological resource assessment. Prior to project approval, waterways should be appropriately identified and avoided or mitigated if impacted.

⁵ ibid footnote 4.

Proposed Mitigation: The local, state, and federal permitting agencies will require setbacks from waterways. Proposed impacts to waterways will require permits from the following agencies:

- U.S. Army Corps of Engineers
- Regional Water Quality Control Board
- California Department of Fish and Wildlife
- Lake County Community Development Department
